# THE HARD FACTS ABOUT PAYROLL/PERSONNEL SOFTWARE.

## In head-to-head competition, software buyers select the ISI Payroll/Personnel System 90% of the time.

Once you have the facts, decision-making is easy. And it's a fact that when ISI competes against other systems, ISI consistently wins out. It just takes a demonstration of ISI software. We're the industry's Payroll/Personnel specialists. And clients recognize the best.

Clients like Ford Motor Company, Harvard University, Phillips Petroleum, Bank of Montreal, First Interstate Bancorp, Hartford Insurance Group, and the State of Colorado, to name a few.

We're miles ahead of the competition in system architecture and system documentation. We offer more real-time, on-line expertise than any other vendor. And we're committed to customer service. We're always ready to be on-site to help with any aspect of your installation. And that includes fixed-price customization.

ISI software is versatile, too. It's designed to run on all IBM mainframes, the IBM System/38 and Prime. ISI supports data base and data communications environments including IMS, ADABAS, DATACOM, IDMS, VSAM and CICS, IMS DC, ADS/on-Line, NATURAL and IDEAL.

Call us. We'll answer your questions with the kind of straight talk and hard information it takes to make informed decisions. We think you'll see why Datamation Magazine ranks ISI number one in payroll/personnel software.

# The Wang PC. The hardware that brings out the best in software.

The Wang Professional Computer runs hundreds of the most common business applications.

And almost all of the most popular software programs – including VisiOn,™ Lotus 1-2-3,® TK!Solver,™ Multiplan™ and Peachtree.™

And because the Wang Professional Computer is more powerful than most other personal computers – including the IBM PC – it runs all of these programs better. Applications are more responsive. Screens are faster. The graphics are sharper.

In fact, many software companies have told us they prefer to see their software demonstrated on the Wang Professional Computer. Which is only natural. Everybody likes to look their best.

For a demonstration of the Wang Professional Computer, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

The old maxim — "You can't teach an old dog new tricks" — is a dangerous tenet to follow at a time when automation technology is invading the workplace.

Those practicing the art of information processing can hardly be considered old dogs — the art is too new. So the question arises — why do so many DP practitioners behave like old dogs?

Speakers on the conference circuit can be viewed as barometers of change. These individuals are often a couple of years ahead of the readiness of information processing departments to adapt new techniques in their organizations.

For the past several years, many of these visionaries, who admittedly often have products or consulting services to sell, traverse the nation haranguing information system specialists about the need to make productivity aids part of the tools of their trade.

Productivity tools such as fourth-generation languages and application development systems have been around for quite a few years, yet they are barely starting to gain acceptance in the DP environment.

Some information processing managers think it's enough if 20% of the shops use these tools, but business reality dictates that 80% of organizations should adopt these productivity aids.

Those information system professionals who resist change and opt for behaving like old dogs will be left behind. Top management has become enamoured of technological wizardry, although they may resist using it themselves. Once they see the benefits derived from automated systems, they expect wonders. The information professional who can show an executive a faster, better way of developing an information management system that monitors and reports on the operation of the business is going to gain recognition in the organization. Those professionals who adapt modern tools to perform these feats will become the shining stars of the organization.

Given the prospect of stardom, why are information specialists holding back on using fourth-generation languages and applications development systems? Some of the major resistance appears to be psychological, particularly among more seasoned programmers. The anxiety associated with change is a big factor. Moreover, programmers perceive these tools as easy to use and anything that is easy to use must not be worth using — or at best it is more applicable to the non-technical end user. And if these techniques are too easy then the mystique associated with system development and programming will disappear, perhaps along with the profession. Yet most younger programmers do not exhibit anxiety or reluctance in using these tools.

While it is true that some productivity aids have been outrageous consumers of computing resources, most vendors on the leading edge say they are aware of this drawback and are taking steps to remedy the problem. Careful scrutiny of these systems is warranted, but many programmers and consultants report that careful use of these systems can reduce development time for an application by 90%. It has been estimated that 85% of the new application development can be done in a higher level language.

Information processing professionals who are receptive to newer programming tools report better relations with end user departments. In fact, some DP professionals are starting to feel threatened by end users who are more in tune with the latest development techniques. One of our authors reports there is often stiff competition between end users and technical personnel for training in new system development methods.

So the old maxim of not being able to teach old dogs new tricks is ripe for an update. Perhaps the popular saying, "Be there, or be square," has more meaning for today's automated business environment.

# *About the Guide*

The *Computerworld Buyer's Guide to Large Systems Software* is a reference manual containing concise descriptions of software products used with minicomputer- and mainframe-based systems and short profiles of the vendors selling those products.

Because of the enormous number of software products on the market, the publisher of the *Computerworld Buyer's Guides* split the software guide into two volumes — one for high-end software and one for microcomputer-based software. The micro software guide will be published at the end of November.

This guide contains six major product sections, each preceded by a fold-out tab divider identifying the products listed within that section. The six tab dividers are: Data Base Management Systems, Data Dictionaries, Decision Support Systems and Report Generators (Section A); System Software (Section B); Utility Software (Section C); Applications: Financial (Section D); Applications: Manufacturing, Banking, Insurance and Order Processing (Section E); and Applications: Payroll/Personnel, Office Automation and Industry-Related (Section F).

Communications software is not included in this guide, with the exception of electronic mail packages which are contained in the office automation product listings. The *Computerworld Buyer's Guide to Communications* features communications-related hardware and software.

In cases where several distinct types of products are listed within one tab section, a gray-colored page with a product classification identifier is inserted in front of the listings for that particular product grouping.

Preceding the product listings is a vendor profile unit (Section V).

The front of the guide features a special magazine containing articles concerning the state of the industry, technology overviews of specific products and issues pertaining to large systems software.

Also featured in the guide is an index which provides a method of quickly locating the diverse products listed in the guide.

---

***PRODUCT LISTINGS***

The product listings contain pertinent technical specifications for the products listed in the guide. Technical data includes information on operating systems, hardware and memory requirements, language and source code availability. All product listings contain information on purchase terms, pricing and installation statistics when vendors supplied such data.

Within each software product category the listings are arranged in alphabetical order by vendor, with product descriptions following in alphabetical order by system name.

In order to allow readers to locate a product more easily, product sections have been broken down into subcategories. For example, the financial applications section groups listings into the following package categories: general accounting, accounts payable, accounts receivable, general ledger, fixed assets, purchasing and integrated accounting.

An example of a typical product listing is shown at right.

***COMPANY PROFILES***

The company profile section of the *Computerworld Buyer's Guide to Large Systems Software* contains each vendor's address and telephone number as well as a listing of key management, marketing and technical personnel within the firm. In addition, the profile includes the company's target markets and revenues, among other details.

# About the Guide

*INDEXING SYSTEM*

Each tab divider contains an operating system index, which is located prior to that tab's complete product listings. The introduction to each index explains the product categories indexed and the abbreviations used in the index.

Each major operating system has a separate heading under which are four columns entitled — vendor, package, section and page. The operating system headings are listed in alphabetical order. For example, readers searching for an integrated accounting package that runs under AOS would find the heading for that operating system, scan the product offerings for that particular product category and locate the appropriate page to turn to for a full description of the product.

Those operating systems that do not have a sufficient number of entries to qualify for separate headings are contained in a section entitled "Other Operating Systems," which is the last heading in the index. This section has five headings — vendor, product, section, operating system and page. The alphabetical order of the operating systems determines the order a product appears in this section of the index. So, for example, readers searching for an integrated accounting package that runs under Artemis would turn to the operating system column in the "Other Operating System" section, locate packages that run under Artemis and see if any appropriate packages are available.

Products that run under more than one operating system are listed under each appropriate operating system.

Examples of the indexing system are shown below.

*THE ENTERPRISE FILE*

The Enterprise File is a data base containing information on thousands of companies that produce or provide computer-related products and services. It is the source of listing information in the *Computerworld Buyer's Guide to Large Systems Software.*

Compiled by International Data Corp. (IDC), the Enterprise File is a complement to the IDC Data File, a well-known data base of end-user facilities.

IDC gathers and regularly updates information contained in the Enterprise File through printed questionnaires and telephone surveys. To date the file contains records on more than 12,000 companies and 30,000 products.

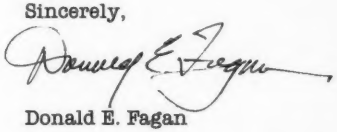
*Note:* Vendors were offered the option of placing their company name in a larger typeface than the standard listing size. Vendors were also offered the option of adding a boxed insert at the end of their listing. These options were paid for by the vendor and should in no way be construed as an endorsement of these companies or products by the publisher of the *Computerworld Buyer's Guide to Large Systems Software.*

# *Publisher's Letter*

Dear *Computerworld* Subscriber:

We have received many requests for more information about the *Computerworld Buyer's Guides*, so allow me to take a moment of your time to explain how they came into being.

We conducted a study a few years ago to determine the usage of buyer's guides and directories. From that study we learned that *Computerworld* subscribers were using the existing guides extensively. However, we also discovered a high level of dissatisfaction with those guides.



Based on these results, we felt there was sufficient cause to begin our own Buyer's Guide series . . . and we were confident we could do a better job than the competition. So in 1983 we launched another study to gather the information we needed to create a complete, accurate, and above all useful series of Buyer's Guides. That year we published our first three guides: Computer Systems; Terminals and Peripherals; and Software.

These were so well received that, earlier this year, we expanded the series to five guides. The guide to Large Systems Software, which you're holding, is one of these. It will be published every June. The other four are: Communications (February); Large Systems Hardware (April); Microcomputer Hardware (September); and Microcomputer Software (November).

You'll receive each guide in the mail, free of charge, as a supplement to your *Computerworld* subscription. I hope you find them beneficial. According to an independent study, you've been pleased with what we've done so far. Eighty-one percent of those people who use *Computerworld Buyer's Guides* rated them "good" or "excellent."

There's always room for improvement, though. Should you have any questions, complaints or suggestions, I'd like to hear from you.

Sincerely,

Donald E. Fagan

# Laying the Groundwork With Reusable Code

By T. Capers Jones

The average productivity rates of industrial and commercial software builders have been in the vicinity of 2,000 to 4,000 lines of source code per programmer year since the mid-1960s. Software projects using relatively modern structured design and development methods tend to cluster towards the high end of that scale, while software projects still doing things the hard way tend to cluster at the low end.

But a few enterprises, such as Toshiba, Ltd., in Japan, are starting to report productivity rates on major systems that exceed 25,000 lines of source code per programmer year, even for large projects that average 200,000 lines of source code in size.

When the technology behind these results is examined, it turns out the high productivity rates are not for conventional software development, but for systems constructed in large part from libraries of standard functional modules, or reusable code.

Other enterprises, such as the Hartford Insurance Group, Raytheon Computer Services, Inc., St. Regis Corp., the Bank of Montreal and the entire banking industry of New Zealand, have discovered that when they carefully examine their application software the same functions show up over and over again: calendar management routines, rate table management routines, merge and selection criteria routines and similar common functions may comprise 30% to 60% of the total code in every application.

If these common functional elements can

be identified, made general enough for widespread reuse and cataloged in a library, then it suddenly becomes possible to create new applications which are constructed from standard pieces, rather than from line-by-line coding.

The enterprises that have been able to do this are reporting significant results: development cycles for major Cobol packages dropping from 36 months to eight months; backlogs of waiting applications have been reduced to nearly zero; and programming staff sizes that remain stable or decline at the same time that annual productivity rates go up at 14% or more.

But reusability is not a technology that can be applied without major organizational and administrative support, and the importance of reusability deserves a careful analysis of what these support requirements are.

### Cost and Schedule Relief

It is obvious that developing a design or module that can be reusable is of no particular benefit to the initial project that does the work. The first project utilizing this technique might well experience cost and schedule overruns. However, succeeding projects will reap the benefits of the reusable code and will experience productivity gains. The high start-up costs of instituting the reusable code approach is the major stumbling block to the adoption of the technique by commercial and industrial enterprises. Unless this problem is overcome, reusability will not succeed because there is no incentive for the initial project to develop reusable components.

The organizations that have overcome this problem have established the reusable code library either as an overhead item that is not charged to any one project, or established it as a cost center that has charge-out rates for its services. They also provide internal schedule allowances and cost relief for functions that have been identified as candidates for reusability. The kind of relief provided can range from the actual internal purchase of the reusable code, to informal understandings that the code will take longer and cost more than normal, due to the need for generalization.

Providing rewards and incentives for developing reusable code is another method of promoting adoption of this technique. Recognition and rewards to the programmers and designers whose work has been adopted for widespread reuse can range from token awards such as framed certificates to cash bonuses based on the estimated programming savings produced. The most common incentive is to start measuring project productivity in terms of delivered code that is turned over to customers, rather than developed code which the project team coded line by line. This is a subtle but profound change in viewpoint, and it is critical to understanding the value of reusability.

A reusable code library with only one or two functions will not be very useful. Between 50 and 500 standard modules are needed to provide 30% to 60% of the common elements in a program. It usually takes more than a year to stock the library and the start-up costs can range from $50,000 to more than $250,000.

One caution is necessary — many enterprises think that they can stock a reusable code library simply by extracting code from existing systems. This method usually fails — it can be likened to trying to build a new automobile with parts from cars found in a junkyard. To work well, reusable code needs to be deliberately planned and designed to share data with other modules. This means adopting standard data interchange formats at the same time as the reusable code concept is implemented and installing a data dictionary to support the reusable code library.

The larger commercial enterprises that have adopted reusable code have gotten started in the following ways:

- Basic functions are selected through analysis of current programs and systems. Often a reusability project manager will be named, or a task force will be convened to explore the potential functions that might be reused by sampling existing application programs.
- Generalize the selected functions for library use. It is safe to use existing programs as the source of ideas and designs for reusability, but they probably will have to be generalized and the code must be cleaned up.
- Hire a librarian and acquire a library support package. Several large enterprises have hired librarians with experience in public or university libraries. The size and nature of the reusable code library could eventually resemble a small research library, ultimately requiring a professional librarian.
- Broadcast the library's contents. Unless the staff knows about the library and its use, it cannot be effective. Many enterprises kick off their adoption of reusable code by having group meetings, putting up posters or by publishing a new handbook describing the facility.

### Involving End Users

The reusable concept covers more than just code, of course, and can be applied to data, designs, documentation and requirements. Once the concept of reusability is adopted, it can be helpful in relationships with end users. When new applications are required, a quick scan of the catalog of standard functions will often allow at least a running prototype to be developed very quickly to show end users how the system might function. And, as the catalog and library of reusable elements grow, more and more often new applications will be found to be only minor variations on the patterns of other applications. Several enterprises have found that by showing users the existing patterns it is possible to satisfy the user requirements by modifying an existing standard de-

sign, rather than by complete new development.

Most significantly, end users are often sources of valuable insight about which functions should be used to stock the reusable code and design library. After all, the functions are usually automating the end user's applications, and the end user will know better what data and functions should be stocked and generalized.

***Many enterprises think that they can stock a reusable code library simply by extracting code from existing systems. This method usually fails — it can be likened to trying to build a new automobile with parts from cars found in a junkyard.***

One of the most technically exciting by-products of reusability is the creation of new kinds of design languages, where a design language is based on the growing catalog of standard functions and reflects its contents. The few enterprises that have developed such languages are able to implement anything they can specify almost immediately, because the design is built from available standard elements. This mode converts the application development process into a type of manufacturing process, where the design consists of a bill of materials for the standard elements, and construction steps for the sequences in which the elements are to be joined together.

The enterprises that report the most success with the reusability concept to date include banking and financial institutions, insurance companies and the information systems portions of large manufacturing enterprises. Some telecommunications companies are making use of reusable concepts, since telephone exchanges perform more or less the same functions even though each country and region may have variations of basic services.

Small enterprises and microcomputer users may actually be at an advantage in adopting both reusable designs and reusable code, since the micro world has a fairly plentiful supply of books on common applications, and many on reusable functions within those applications. Although Cobol is the language of large-scale business programming, a visit to the computer section of most reasonably well-stocked book stores will turn up 10 to 25 volumes on using Basic for common small-business applications, many with actual listings, and a few with the programs or subroutines available from cassettes or disks as well.

Although not widely cited in the literature, government at the national, state and local levels would find reusable software to be uniquely cost-effective. Indeed, some sharing of common reusable code is already taking place at the community and even at the state levels.

The new Ada language and environment created under the auspices of the U.S. Department of Defense has built-in facilities to make reuse easy, and it can be anticipated that the reusability aspect of Ada will eventually allow the Department to create what may become the world's largest library of standard reusable code. If so, the ever-mounting Defense Department software budgets may actually stabilize.

In Japan, due to the lack of the U.S. antitrust laws and the government's long-standing policy for getting competitive companies to share ideas and cooperate, reusability is emerging as a major national goal. The 1976 creation of the Joint System Development Corp. has given Japan a national resource for reusable designs and code that is currently supported by over a hundred Japanese companies and the Ministry of International Trade and Industry. As of 1984, no other country is so well positioned to take advantage of reusable code and standard programming functions as Japan.

### Reusability In The Future

Today, reusability is still an emerging technology which various enterprises are tentatively exploring, and a few are starting to use with significant results. As the concept spreads and more experiences are gained, a few trends can be predicted:

- *Commercial Reusability Tools.* Except for a few early commercial ventures, such as the ReadyCode package from Raytheon, most U.S. work on reusable code is taking place at individual installations. It is anticipated that in the near future software vendors will start marketing reusable code tools to clients in the banking, insurance and other high-reuse areas that contain a library structure and data interchange support, plus perhaps a stock of standard functions.
- *Language Extensions for Reusability.* Cobol was designed as a general-purpose business language, but its designers were not actually aware at the time of what business applications Cobol would be used for. It is now possible to extend Cobol and make the extensions "verbs" which facilitate reuse of functions that occur with high frequency in business applications, such as calendar manipulation, break points and currency conversions.
- *Reusable Design.* Today if you wish to buy the plans for a house, you can select from hundreds of blueprints and construction plans offered everywhere from national magazines to local lumber yards. But if you want to buy the design for a new payroll system, you cannot. As the software industry matures, the past emphasis on general methods for building almost anything will be seen as a sign of immaturity, and a new concept of standard, optimized software blueprints for common applications will start to appear. Thus, it may soon be possible to buy commercial plans for com-

# HIGH-PERFORMANCE SYSTEMS SOFTWARE, THE CAMBRIDGE WAY.

## Three Innovative Ways To Bring Strong, Stable Control To OS/VS Environments.

We're The Cambridge Systems Group.

We built a solid reputation on delivering high-performance systems software that manage and control critical functions in OS/VS environments: innovative and non-traditional software known for reliability, integrity, and quality.

That's why 1800 organizations, including many Fortune 500 companies, now use our products, worldwide.

All our A**2 family of high-performance systems are easy to use.

*ASM2, Automated Space Management*, optimizes DASD utilization while it saves money — enough to pay for itself within a year.

*ACT2, Access Control Facility*, with over 1200 users, is the accepted standard for security software in MVS, VS1, and VM environments.

*ADC2, Automated Data Center* management information system, brings increased control and throughput to MVS systems users. ADC2 can schedule jobs the same day it's installed.

Call or write for our new brochure. See for yourself how one oak tree clearly stands out from the grove.

mon kinds of application and system programs, rather than having to design each application as a new creation.

● *Migration of Common Functions into VLSI.* One of the most significant by-products of the exploration of standard functions and reusable code will be the eventual migration of high-frequency functions from software into very-large scale integrated (VLSI) chips which will make these functions both widely available and also augment their performance. For example, there is no reason why clock and calendar management functions cannot become standard VLSI features. Indeed, the next generation of microcomputers will probably feature integral world clocks and perpetual calendars which will make scheduling and multiple time-zone applications a great deal easier to coordinate than is the case today.

● *Reusability and Parallel Processing.* Functions that are truly reusable have an unexpected benefit which has not yet been widely exploited due to the lack of suitable hardware — reusable functions can be executed in parallel. With new parallel computer architectures, such as the emerging fifth-generation computers, it should soon be possible to execute from 50 to several hundred functions at the same time in parallel. The implications of this to business programming have barely been considered, but some of the potentials are intriguing. Imagine a payroll program that is capable of simultaneously handling 50 or more accounts at the same time or a banking system that can keep track of perhaps 1,000 transactions simultaneously. The result will be supercomputer speeds applied to humdrum applications, with the only limitations on throughput being how fast paper can be physically moved into and out of the computing facility.

Reusability is an exciting prospect, both because of the impact it will have on productivity and because reusability is a key step toward making software engineering a true engineering discipline which can produce systems with predictable results.□

# A Better View Of the Data Base

By William B. Engle

The benefits of any data base management system (DBMS) — even the most sophisticated — can be realized only through the user/system interfaces that facilitate and support the use of the system and the data resources. In evaluating these tools great emphasis should therefore be placed on the user-oriented aspects of the interface.

The two basic user/system interfaces of a DBMS are the programming language interface and the query language interface. Use of a programming language interface requires programming expertise, whereas the query language interface is designed for use by nontechnical end users. A facility that allows programmers to address and manipulate the data base is an essential part of a DBMS. Therefore, most DBMS have adequate programming language interface facilities. The same cannot be said for a query language interface.

DBMS packages vary widely in providing flexible and easy-to-use query facilities. Some packages with strong query language capabilities may not be able to satisfy other processing requirements.

Query language processing requires substantial end-user sophistication and imposes additional processing overhead on the system. Besides the substantial software cost for such processing — often up to $50,000 for the license fee — there are costs for educating hardware users. Rarely can a query language interface begin to approach the operating efficiency of a programming language

interface and in most cases it entails increased CPU utilization and processing time.

Because processing time for a query language interface is not considered essential by all vendors and can be expensive, the need for it may be questioned. In many instances, however, a query language interface saves human resources, reduces the time needed for high-priority processes and provides timely information for managerial decision making.

***The administration of query language capability affects its overall cost-effectiveness. If query language processing is directly available to end users, they will have to be trained. The costs incurred through possible user abuse of the interface must be added to this direct cost.***

Several factors should be considered when determining the need for query language processing and the level of capability required. These include the frequency, immediacy and seriousness of requests, the sources of ad hoc requests and whether query language interface processing is applicable to the production needs of the environment.

Much processing can be anticipated, planned and programmed; such processes may be batched or transaction-driven, but finite, identifiable and specific information needs must be satisfied by the data. For example, inquiries into a work-in-process file that generate a formatted response indicating job status, target date and slippage of a selected shop order are not ad hoc processes. Although they are transaction-driven and probably on-line, these inquiries can be anticipated and are used many times a day.

Ad hoc queries, on the other hand, refer to processes that cannot be planned. They usually entail extracting information from the data base that has never been requested in that particular form. Examples of such queries are an alternate sort order for output or a request to relate two or more items of data not usually related. Most DP installations receive many such requests; in fact, some large shops have established a special group of programmers to respond to ad hoc requests on a full-time basis.

A query language interface is designed to bypass several steps in the programming process — coding, keypunching, debugging and testing. When query language interface processing is directly available to users, communication between users and programmers is usually reduced or even eliminated. Bypassing these time-consuming processes often enables the user to generate information within minutes. If ad hoc requests involve crucial information that must be produced quickly, a query language is probably the solution.

The administration of query language capability affects its overall cost-effectiveness. If query language processing is directly available to end users, they will have to be trained. The costs incurred through possible user abuse of the interface must be added to this direct cost. If, on the other hand, the query language is administered centrally through the data administration staff, the cost of communication between the staff and the users must be considered.

A query language interface module, unlike a program written for a specific application, must be capable of performing a large number of processes. Query language interface modules are generalized software, created to service the widest possible spectrum of processing requirements. As such, they contain much specialized ad hoc logic that may not always be necessary. Furthermore, query language interface modules must interpret user queries. This necessitates scanning, editing, table searches and reformatting before actual requests can be made on the data base. Query language interface modules must also format output as user specifications direct.

Scanning and interpreting entail a certain amount of CPU overhead. To determine the amount of overhead for a specific DBMS, a program can be created to perform the query, and the CPU time used by the programmed query can be compared with that used by query language processing.

The more sophisticated query language interface logic modules can add 100K bytes or more to memory requirements. Although this generally can be overlaid or placed in virtual storage, it still affects the efficiency of query language interface and other processing. Query language interface processing may also require larger buffers and user work areas.

In addition, a query language interface creates a greater processing load on the I/O channels. A programmer can specifically designate how queries are to be processed and gain processing efficiencies that a query language cannot hope to match. The user who incorrectly specifies a query or queries that require passage of the entire data base may create a load that temporarily ties up the entire system.

Finally, if interface capability is to be made available to a wide range of users, questions of data privacy and security should be examined.

Although capabilities vary in sophistication, a basic set of functions must be present in a query language interface. The user must be able to specify the action to be taken, the data type or types on which the action is to be taken and the qualifying characteristics of the data.

Thus, in the directive: "PRINT ALL PERSONNEL RECORDS FOR PERSONNEL WHOSE DATE-OF-HIRE IS 03/21/81," the word PRINT is the action to be taken, the phrase ALL PERSONNEL REC-

ORDS is the data type on which the action is to be taken, and the phrase FOR PERSONNEL WHOSE DATE-OF-HIRE IS 03/21/81 is the qualifying characteristic that determines which personnel records are to be printed.

Query language interface systems can vary in the number of different actions that can be specified, in the number of different data types (such as records, elements and fields) that can be specified in one query and in the sophistication of the qualification phrase that the user can specify.

The role of a query language has traditionally been ad hoc processing and responsiveness to nonstandard management information requirements. They can satisfy other needs, however, particularly in production operations and as a programming aid and administrative tool. Although these additional roles have not often been assigned a great deal of importance in determining query language processing needs, they should be recognized and included in any evaluation.

Query language interfaces range from the simple to the very complex. The term complex does not imply difficulty of use, but rather that the more complex interfaces provide more sophisticated processing capabilities and are better suited to management inquiries. The sophistication is more a function of the architecture and associated capabilities of the DBMS than the inventiveness of query language interface design.

Query language interface capabilities developed for the Codasyl-type DBMS, such as Cullinet Software, Inc.'s Integrated Data Base Management System (IDMS) or the Sperry Corp.'s DMS-1100, are relatively simple in nature. Codasyl-based systems are based on single-key identification of records rather than on the index-inversion techniques that facilitate query language interface processing, which until recently has not been a formally stated Codasyl requirement. Market pressure, however, prompted such vendors as Cullinet to develop query language capabilities along with the necessary index-inversion structures.

The sophistication of many interface features of other DBMS is not yet present in the Codasyl-compliant packages; a full Boolean set is not supported, and update capabilities have not been implemented.

Three widely known DBMS — Intel Corp.'s System 2000/80; Software AG of North America, Inc.'s Adabas; and Infodata Systems, Inc.'s Inquire — illustrate the linguistic capabilities of complex query language interface facilities. All three systems support a structure geared to the language they use. They provide an indexing technique — full inversion for System 2000/80 and Adabas, a threaded list for Inquire — and a manner of relating inquiries across different record types — System 2000/80 through its hierarchy, Adabas through coupling and Inquire through its Connect capability. All provide Boolean search capability.

The differences among the languages are subtle and at first they appear equally capable. The analyst should assess structural limitations, volume processing considerations, performance criteria and ease of use.

In addition to simple queries, each system is capable of detailed format controls, summations, tabulations, editing and other tailoring. Although simple queries can be learned in a few hours of training, more classroom time and hands-on experience are necessary before the user is familiar with the majority of capabilities of any of these systems. Nonetheless, it should be apparent that System 2000/80, Adabas, and Inquire all provide powerful query language capabilities. These capabilities permit complex queries to be constructed with relative ease, in contrast to programming techniques.

In many areas, however, these three packages cannot compete with the power of a programming language. Most query languages are descriptive in nature. For example, the user describes the type of data desired and the interface itself triggers whatever repetitive looping is required to satisfy the request. There is no provision for intermediate calculations. They permit searching for individual orders of the specific amount or more, and they permit totaling orders by customer, but they contain no provision for calculating the sum of orders for a given customer and then using that sum to determine whether the order should be listed.

***The differences among the languages are subtle and at first they appear equally capable. The analyst should assess structural limitations, volume processing considerations, performance criteria and ease of use.***

### Current Offerings

The following discussion examines some data base management systems' currently available query language interface capabilities and discusses some of the reasons — such as structural or historical — why certain packages provide specific interface capabilities. This discussion should not be viewed as a guide to query language interface selection, but as a survey of the more prominent packages offered. Furthermore, a DBMS should not be selected primarily on the basis of its interface.

● **Software AG's Adascript+ and Natural.** The standard query language interface for Software AG's Adabas is Adascript+; a higher-level language, Natural, is available at additional cost. Adascript+ is an interface module that permits the use of Adabas as a self-contained system. It can be used in batch mode but is most commonly used with on-line terminals. Adascript+ is an easy-to-use, English-

like language that can be taught to non-DP operating personnel in two to three hours. Frequently used Adascript+ queries can be cataloged; a macro facility further simplifies their use.

Natural is a powerful natural language that provides end users as well as programmers with an easy-to-use facility for ad hoc data base inquiry, updating and report generation. Natural can also be used for screen format generation, data entry through predefined screens and on-line transaction processing (non-Adabas files can be processed). Natural facilitates a relational data structure by allowing users to process, in one program, logical relationships from data in several files or data from an individual file in several different ways. The data dictionary is necessary when Natural is used to access Adabas files.

● **ADR's Dataquery**. Applied Data Research, Inc.'s (ADR) Datacom/DB offers the Dataquery package as the query language interface. An English-language query facility, Dataquery operates through any data communications network to inquire into and analyze the contents of a Datacom/DB data base. Its Boolean logic abilities, together with the semirelational structure of the data base, allow very complex queries to be specified. Arithmetic capabilities allow manipulation of data fields and display of results. Comprehensive output facilities provide report formatting and printing as well as selection and paging of output on display terminals. Dataquery must be used with ADR's Datadictionary.

● **Cullinet's On-Line Query and On-Line English**. With its IDMS, Cullinet offers a choice of two query language interfaces, On-Line Query and On-Line English. On-Line Query provides data base access by means of a simple, English-like command language. Results can be displayed on a CRT terminal or printed, and data can be retrieved either from logical or physical data base position or by index value. Using Boolean logic, On-Line Query allows application programs to concatenate record selection criteria by means of logical connectors. Users can catalog frequently performed command sequences.

Requests can be submitted in normal conversational terms to the On-Line English interface, which accepts ordinary English phrases, translates them into computer terminology, retrieves the requested data, performs simple computations when necessary and displays responses. On-Line English does not access the data base directly but achieves rapid response by querying a retrieval-only file that contains only the fields needed for a particular query application. Definitions of these read-only files are prepared by a system administrator; they then become an integral part of the working system.

● **IBM's IQF, GIS/VS and SQL**. IBM offers the IMS/VS user two choices of interactive query facilities. The Interactive Query Facility (IQF) allows the applications programming function to be performed at a terminal. With no knowledge of programming, the user can instruct the IQF to list and count data fields, perform sorting functions and format output. IQF can also use the many data base utility programs available for IMS/VS.

The Generalized Information System/VS (GIS/VS) is a structured file information handling system designed for a dynamic operational environment. Combined with IMS/VS, it provides a set of generalized routines for data set creation, maintenance and retrieval. New or existing files are described in a procedure that does not require detailed programming. These file descriptions allow the user to address the contents of files by symbolic names. It is not necessary to repeat the size of each field, its unit, relative location or other data management parameters in every procedure.

IBM also introduced Structured Query Language/Data System (SQL/DS) as a relational data base management system. Because SQL/DS is offered as a complement to the DL/1 DOS/VS data base management package and is highly query-oriented, it should be included in a discussion of the major query languages. For larger mainframes the newer Data Base 2 is based on SQL/DS and is available for MVS systems.

SQL is a high-level language available to users through a CICS/DOS/VS transaction or equivalent, a batch utility and application program. The language supports data definition, access, manipulation and control operations. SQL statements consist of command verbs, optional clauses, language keywords and parameter operands. The structured use of verbs and keywords in the SQL syntax allows the precise specification of data requests in a readable fashion.

● **Infodata's Inquire**. The self-contained Inquire user language by Infodata Systems provides an effective query language interface. The English-like language implements the functions of information retrieval and report generation, data base maintenance and administrative control of processing. Queries can retrieve data either by direct (keyword) or sequential (field-value condition) searching of data bases or by a combination of both methods. Direct-access retrieval can be accomplished by specifying keyword roots as well as complete keywords in the selection criteria. A macro facility extends the user language, providing facilities from storage of routine commands to customizing interactive languages with user-prompted variables.

Inquire is unique in providing for text storage, manipulation and retrieval in addition to the usual DBMS capabilities.

● **CCA's Model 204**. The query language interface for Computer Corp. of America's (CCA) Model 204 is furnished by the user language option. Although the Model 204 user language is one of the more complex and sophisticated

# LOOK INTO OUR MANUFACTURING CONTROL SOFTWARE.

### YOU WILL FIND OVER 700 INSTALLATIONS ALREADY BENEFITING FROM IT.

Benefiting through reduced inventory costs, increased productivity and improved customer service.

MAS-Manufacturing, the closed loop Manufacturing Resource Planning System from Martin Marietta Data Systems, has been delivering key benefits like this to hundreds of companies around the world for over a decade.

### YOU WILL FIND A FLEXIBLE SOFTWARE SYSTEM AND HARDWARE INDEPENDENCE.

MAS-Manufacturing is the fully integrated on-line Manufacturing Control System with the built-in flexibility to be used in a wide variety of manufacturing companies—both large and small. And since our system is made up of integrated modules, your company can implement them as your business or budget dictates. Without the overhead of installing functions not required.

MAS-Manufacturing delivers results by synchronizing the six most critical elements of your company's manufacturing operation:

- ☐ Master Production Scheduling
- ☐ Inventory Control
- ☐ Manufacturing or Shop Floor Control
- ☐ Purchasing
- ☐ Cost Control
- ☐ Engineering Control

And we're flexible when it comes to providing you with the hardware option that meets your requirements. MAS-Manufacturing operates on *a wide variety of computer systems* from IBM mainframes and 4300 series computers (including the 4321/SSX) to Hewlett-Packard 3000's and DEC VAX minicomputers. For use on your machine or we'll supply the hardware too.

You can even use MAS through our Remote Computing Service, avoiding any hardware investment or commitment. And, because of the hardware versatility of MAS-Manufacturing, the system can easily be brought in-house in the future.

### YOU WILL FIND UNBEATABLE SUPPORT, TRAINING, AND DOCUMENTATION.

As with every Martin Marietta product, you and your company can rely on us for full support. Our manufacturing and data processing specialists are always ready to assist you throughout each step of the planning, installation and implementation.

You will also find us ready to address your needs for software customization and user training. We can provide you with full maintenance services—including a special Customer Service Hotline.

And to top it off, you will be pleased to find that our documentation is as comprehensive as you would expect from an industry leader.

### YOU WILL DISCOVER A GROWING MAS FAMILY OF PRODUCTS.

We recognize that there is more to a manufacturing company than manufacturing control. To meet your company's complete needs, we offer a growing family of MAS products including:

- ☐ MAS-Manufacturing
- ☐ MAS-Personnel and Payroll
- ☐ MAS-Financials
- ☐ MAS-Project Management
- ☐ MAS-MODEL

Not to mention the 100-plus software packages offered on our remote computing services network.

We plan to continue our efforts as your total information services company by adding even more quality products to our growing MAS family.

### YOU WILL REALIZE THAT RESULTS ARE ONLY A COUPON AWAY.

Whatever your manufacturing control or information services requirements, we have a system which can give you tangible, bottom line benefits. Fill out the coupon and mail it—we'll send you complete details on how Martin Marietta Data Systems products can start paying off for your company right away. Or better yet, call us toll-free at (800) 638-7080. In Maryland, (800) 492-7170.

query languages, it is considered easy to learn and use. It offers multikeyed retrieval functions that can be based on complex Boolean expressions, string manipulation, sophisticated mathematical functions and report generation. Programs can be created, stored in the system and recalled for use as procedures that can be modified through an on-line editor. Statements in a program are named and can have nested, subnumbered statements associated with them; various forms of loop control are provided for use within nested structures.

● **Mathematica's Ramis II.** The query facility for Mathematica Product Group, Inc.'s Ramis II is its built-in language processor, which accepts free-form, nonprocedural English statements. A large repertoire of commands is used to define, access and maintain a data base; create reports in a user-defined format; generate graphic data; create catalogs of frequently used procedures; and build macros of various Ramis II functions. The language is straightforward, yet it offers such sophisticated abilities as table lookup, concatenation of character strings, and highly complex mathematical operations.

● **Intel's Quest and Quex.** Intel offers a choice of two subsystems for use as query language interfaces, Quest and Quex. Quest, which has been in use for some time, is an English-like relational language facility that can be used by programmers or end users for creating, testing, and updating data bases as well as for ad hoc retrieval. It can be operated in on-line or batch mode. Selection criteria are specified by a "where" clause that provides simple syntax for relational access to items and records for retrieval or update.

Quex (Query/Update by Example) has been recently introduced as a general-purpose on-line data base management program that provides access to data without requiring a specialized data access language. The user is presented with a menu of items authorized for access, enters criteria for data selection and chooses the action to be taken from a menu of commands. An embedded "Help" function provides on-line assistance.

● **Cincom's T-Ask and TIS/Query.** Cincom Systems, Inc. offers two optional query language interfaces, T-Ask and TIS/Query. T-Ask, a well-established package used by many of Cincom's Total DBMS installations, is an on-line, directory-driven interpretive query processor that uses an English-like syntax. T-Ask's data directory contains data names and their attributes, relationships between data names and relationships between data names and users. T-Ask also operates in a directory maintenance mode for the data administrator and a catalog mode that allows users to execute previously cataloged procedures. TIS/Query, a new higher-level product designed for use with Cincom's TIS, offers all the capabilities of T-Ask with a higher level of user friendliness. Designed specifically for use with Cincom's newly developed comprehensive TIS software, which is based on an integrated data dictionary concept, it provides for report generation as well as interactive data base query.‡

# The New Engineers

By Don Campbell

In terms of the history of computing, application development systems are still relatively new. Most of these systems were first introduced in the late '70s and early '80s, although some products had arrived on the market a few years earlier.

At first, some DP shops were reluctant to accept these new tools. Weaned on Cobol and other so-called third-generation languages, DP professionals were reluctant to invest time and resources in learning how to use application development systems. Perhaps they were also wary of claims by vendors that the new tools would increase programmer productivity by factors 10 or 20 times greater compared with Cobol.

Today, however, the jury is in on application development systems and the verdict is quite positive. Properly used, application development systems can increase productivity in almost any DP shop. The actual percentage of increase will vary according to the product selected, the way it is used and the complexity level of the applications the system is used to generate.

The initial resistance to change was, in some respects, understandable. Many DP shops have invested heavily in Cobol-developed programming. Converting all of these programs to a new fourth-generation language would be expensive and time consuming. However, many users of application development products are writing nearly all of their new applications with these systems, now hoping to achieve a non-Cobol environment.

Application development systems have emerged as one of the fastest growing software market segments in the industry. Among independent software vendors, revenues from these products totaled $215 million in 1983. The market is expected to reach $1 billion a year by 1987.

User case histories regarding application development systems in use abound, with reports of productivity gains of anywhere from 10% to 400%. Some examples:

- A large chemical company rewrote its entire order processing and invoicing system with an application development system. The resulting system was operational in less than a year and required 50% less code and less than 25% of the development time of the system it had replaced.
- A state highway patrol agency reported that programmer productivity has increased so much since the introduction of an application development systems product, that their ratio of programmers to analysts has shifted from 3:1 to almost 1:1.
- A supplier of plastic products for durable goods benchmarked an application development system against Cobol-XT and found that some applications were developed as much as 10 times faster with an application development system.
- A large tire manufacturer found that using an application development system resulted in productivity improvements of more than 400% in the updating of data base files.

***Not only will an application development system allow programmers to write good code quickly, it will also help them write bad code quickly. Clearly, an increase in the speed of producing lines of code does not constitute a gain in productivity in and of itself.***

Most development system suppliers can produce similarly enthusiastic endorsements from users. These levels of productivity improvements demonstrate that an application development system can literally pay for itself in a very short time after installation.

Readers of such glowing recommendations should look closely at productivity claims, however. They are not always what they seem. While virtually any application development system will give programmers the ability to produce lines of code quicker than Cobol, the quality of the code that is being produced must be examined.

Not only will an application development system allow programmers to write good code quickly, it will also help them write bad code quickly. Clearly, an increase in the speed of producing lines of code does not constitute a gain in productivity in and of itself.

A more useful measure of productivity should factor in the complexity of the application being developed. One system user has developed an index of complexity that factors in the number of screens, data base files, file views and batch reports that are required by a given application.

In measuring the impact of its product on programmer productivity, this user found that for a certain system, productivity actually declined 36% in terms of lines of code. However, when the above complexity index was applied, they found that the system developed was 46% faster in terms of the total number of programmer hours required per function.

This user compared the development factors of six systems that were produced prior to the introduction of an application development system with five that were produced with the system. In every case, the number of programmer hours for both on-line and batch programs was reduced dramatically, resulting in productivity increases from 70% to 97%.

The best measure of productivity is results. How long did it take from initial request to the finished product? How many programmer hours and how much machine resources were consumed? Did the finished application actually perform the function for which it was designed? And, how much maintenance is required to keep the application operational?

It is relatively easy to track the answers to such questions and assign cost factors to each. The most meaningful measure of productivity is the bottom line in terms of time and resources.

### Putting a Dent in the Backlog

Application development systems are in widespread use today largely because they remain the best offense DP can mount against the ever-growing backlog of applications. Depending on which studies a user reads, the average DP shop has an application backlog of anywhere from two to three years. For large Fortune 500 organizations, that figure is closer to five to seven years.

The backlog gets larger each year, despite increased manpower and equipment budgets. The annual gap between capability and demand ranges from 20% to 50%. And if you talk to end users the story gets even sadder.

A study by MIT's Sloan School of Management uncovered an "invisible backlog" of applications that end users need, but have not even bothered to request. Conditioned by DP to huge, lengthy backlogs, end users need applications that increase the above figures by a factor of 1.8, according to the study.

Can application development systems come riding to the rescue of frustrated end users and harried DP shops? The answer is yes, provided that the tools are properly planned and used effectively.

### The Importance of Integration

The best way to achieve maximum impact from an application development system is to take a long hard look at the overall corporate computing environment. Some organizations, responding to the pressures of their backlogs and the demands of end users, have made the mistake of selecting non-integrated development system products.

This kind of response leads only to fragmentation and the problems

of incompatible software, treating a symptom rather than addressing the cause. A more rational approach is to develop an overall corporate computing strategy that includes integrated software products throughout the organization.

A vendor who can supply a development system product that is completely integrated with a data base management system (DBMS), decision support tools, a materials resource planning system as well as personal computing software will give the DP shop an integrated, compatible environment in which to use the application development systems to maximum benefit.

***When comparing one vendor's application development system with that of another, some users are seduced by the various bells and whistles of the competing products. Buying an application development system strictly on the basis of features is a big mistake.***

For example, if decision support tools are written in the same language as the application development system, new applications can be developed by programmers as well as by end users. This level of integration makes the current "information center" concept a practical reality.

When comparing one vendor's application development system to that of another, some users are seduced by the various bells and whistles of the competing products. Buying an application development system strictly on the basis of features is a big mistake.

With application development systems, there is a trade-off between features and performance. It's a matter of apples versus oranges. If you were deciding between two different automobiles, for example, you might at first decide that the one with air conditioning, cruise control and so on was the better car. However, such features will impact the car's overall performance, fuel economy and price. Similarly, feature-rich application development systems come equipped with various seemingly attractive bells and whistles. The buyer must decide whether or not such features are really important and weigh those features against such factors as performance, response time and so on.

In comparing one development product with another, always keep in mind your overall computing goals. What do you want to accomplish? How does this product fit into your computing environment? What is the best way to maximize your budget? Then look for the system that best fits your organization's unique needs.

There are, however, certain issues that a good application development system should address. More than mere bells and whistles, these issues affect the way the system is integrated with the entire corporate computing resource.

*Efficiency.* A good application development system will provide execution performance figures no greater than 2:1 when compared with Cobol. A system that consumes four to five times the normal equipment resources is much too expensive and provides unacceptable response time.

*Usability by nonprofessionals.* The language of the application development system should be complex enough for a professional programmer, but at the same time should be relatively easy to learn by large numbers of end users.

A major oil company has found that its application development system is very easy for geologists and engineers to learn. In making calculations and analysis for deciding where to drill new wells, end users found that what used to take four to eight hours can now be done in 15 minutes.

*Prototyping techniques.* The ability to use prototyping and step level refinement techniques with an application development system product provides DP with the ability to interact closely with end users during the design and testing stages of an application.

These methods allow the user to iron out bugs in the application before it is put on-line. Errors that turn up during the prototyping stage are much easier and less expensive to correct than those that appear when the finished application is put into production.

*Operating system and hardware independence.* Many organizations are using hardware from different vendors at different levels of the corporation. For example, a corporation may have an IBM mainframe at headquarters, Digital Equipment Corp. VAX minicomputers at its various divisions and Wang Laboratories, Inc. micros at the desktop or workstation level. The application development system product selected should be capable of supporting all these levels of the overall corporate computing resource.

*File Support.* While the application development system should support its own files, it should not be dependent upon, nor require this kind of file support as a prerequisite. Standard Vsam and DBMS support is imperative. Since new applications will be built primarily on new data base and data structuring technology, the tool must be fully integratable into these new technologies at the highest and most logical levels of support. Users must be able to exploit new technology when it arrives, without extensive (and expensive) conversions of existing systems.

*Procedural Power.* To meet the full spectrum of needs for all users, from the simple to the most complex and from business needs to scientific applications, the system must have the power of a procedural language. True application development systems provide the flexibility and richness of instruction sets that had previously only

been available with languages such as Cobol, APL and PL/1.

*Interpretive Benefits.* The major disadvantage of third-generation procedural languages is their two-phase Compile/Execute design. The need to compile and recompile whenever a major change occurs is a major cause of the need for nearly constant maintenance of these applications.

A key design feature of any application development system, then, is that it be fully interpretive so that instructions be can be executed without compilation. If the application development system can maintain the 2:1 execution performance ratio mentioned previously, overall consumption of computer resources will not necesarily increase, because the resource-consumptive and time-consuming compile phase of Cobol is eliminated by interpretive systems.

*Integration.* Another important feature in an application development system is the integration of all facilities, including screen, file, access and prompter design and so on through a powerful central directory to provide fully integrated application development. From an operational standpoint, newly created applications can be integrated with existing applications not written with the application development systems.

*Flexibility.* Look for a development system that will allow applications created with it to be independent of operating systems on communications monitors, allowing applications to migrate between them without change. This feature provides a great deal of flexibility in multienvironment organizations and is crucial for long-term planning.

### Future Trends

The costs of programming and development have accelerated to the point where more and more DP shops are buying packaged applications instead of developing them in-house. Again, this is where an integrated approach to software implementation can yield major benefits.

If your organization acquires an application package that is fully integrated with your development system, you can use the tool to customize the packaged application quickly and easily to meet your special needs.

Another similar trend is the movement to expert systems, packages that address a highly specific application. The oil company mentioned earlier has used their application development system to develop a system that models petroleum fields for exploration. If they choose, they could market this system to other oil companies and profit from their expert use of their development system.

Clearly, application development tools have come into their own in the last few years. More than simply a means to increase productivity, these tools are rapidly becoming the integrators of the corporate computing resource. Application development systems are propelling the modern DP shop into the future of computing.□

# The Changing Role

By Naomi Karten

One of the dependable constants of data processing is the adversarial nature of the user-DP relationship. Users don't know what they want from a computer system and DP delivers too little too late, if at all, so the lament goes. It is de rigeur for articles on this subject to include an assortment of prescriptions for remedying the situation.

End-user computing via fourth-generation languages, microcomputers and information center support is widely touted as one such remedy. According to information center advocates, if DP provides users with the means to access corporate data and to develop some of their own applications, users will view DP in a better light.

As an information center manager, I have had frequent contact with other information center managers, management, information systems professionals, users, vendors and training personnel. In spite of our different perspectives, we are generally in agreement — end-user computing has relieved certain difficulties inherent in the user-DP relationship, but it appears to have spawned new problems and challenges.

# of the DP Manager

As users have learned to write mainframe programs (simple and English-like though they may be), they have begun to see the world through DP's eyes. One DP manager described a user who became "an ally of DP after receiving extensive information center attention." The user's manager, meanwhile, continued to complain about his difficulty in getting DP to act on what he called his "simple, 10-minute requests."

Many information center managers have similarly found that previously difficult users often have more empathy with their DP counterparts than with their nontechnical peers and management. These newly trained users are now accepting some of the responsibility for educating their departments about the complexities and idiosyncrasies of data processing.

Yet several DP managers interviewed recently report trained users now question why DP makes application development seem so complicated. Not surprisingly, however, these and other managers were unwilling to risk aggravating an already difficult situation by having their names or their company names published.

To DP, the difference between an eight-line

fourth-generation language report program and a 200-module corporate-survival production system is obvious. However, to many users, programming is simply a matter of "ADD SALARY BY DEPARTMENT, DIVIDE BY NUMBER-OF-EMPLOYEES, PRINT BY DEPARTMENT." Some of these users now judge DP as being guilty of a history of excessive estimates and cries about complexity. DP is finding that these users are quicker to challenge development estimates.

From the DP perspective, all the media hype about user-friendly products is exacerbating the attitude of these doubting users. As a manager who found few products to be truly friendly to users, I had to convince my users to be more skeptical of vendor claims. It is an ongoing struggle because the grapevine has spread the message of fourth-generation language benefits to users everywhere.

Consequently, DP is seeing an increase in user requirements in terms of "I want it flexible. I want it easy to use. I want it next week." In spite of the prevalence of application development tools, widespread DP use of these tools is still limited in most companies. Thus, users interpret the familiar DP explanations about the difficulty of satisfying these requirements as more of the same excuses.

Bob Yindra of CY Training Associates, a Connecticut-based training organization which teaches Information Builders, Inc.'s Focus to both DPers and users, sees fourth-generation technology as very positive for the user-DP relationship. He recalled that with second-generation technology, users and DP were not very far apart. The third generation brought genuine technical complexity. Users became frustrated as they watched DPers become increasingly distant and aloof, separated by a mountain of paperwork and a remote data center. "The result was a chasm between DP and users," which is decreasing with the fourth generation, according to Yindra.

These views were mirrored by several application development managers. Programmer reaction to end-user computing has been less negative than DP managers initially feared. DPers — both programmers and managers — are happy to be able to pass on the previously never-ending ad hoc user requests to the information center. With fewer interruptions for "gotta-have-it-now" requests, DP departments have had a better crack at getting out of a reactive mode, and devoting full attention to their scheduled commitments.

### Growing Sophistication

In carrying out these commitments, DP is finding the growing technical sophistication of users to be a boon. According to Ed Lahage, DP manager at Blue Cross of Massachusetts, "a typical user these days knows much more than the old user." He has found that with increased comprehension of concepts DP takes for granted — records, files, merges and so on — users have been better able to discuss their DP needs and to assist in resolving problems. "We have much more of a partnership with our users now," Lahage notes. "We have a real opportunity to work together. If we don't all cooperate, it's a real waste."

Despite their current level of technical sophistication, users know less than they think about DP. New users, through no fault of their own, have little appreciation of the complexities of building and supporting major systems. These users are unfamiliar with what *Computerworld* columnist Jack Stone referred to as the "tough, unsung, dirty work" with which DPers are all too familiar.

In addition, users are now demanding technical explanations when things go wrong. In the old days, when there was a production problem, DP told the user there was "a problem with the franistan," as one DP manager put it. The user made a note of this and went away satisfied. Now users want answers that make technical sense.

Another problem arises because most application development is still done in Cobol and other traditional languages. Inevitably, many users know fourth-generation languages and many DPers do not. To put it mildly, this can be embarrassing for DP. One DP manager, who was adamant about remaining anonymous, complained about the awkwardness of being confronted by a user who claimed that "you could do it faster" with SAS Institute, Inc.'s SAS. In one recent experience, "my programmers estimated 12 weeks for a project. My users told me to give it to them and they'd have it done in 2 weeks."

Fortunately, DP managers are becoming more conscientious about training their staffs in the tools users are learning. They are finding the benefit twofold — DP can continue to stay a step ahead of users on technical matters and is rapidly finding ways to incorporate these tools in their own work.

The result, however, has resulted in a new form of turf politics. DPers have always been eager for more technical training. Now, users are hungry for the same kind of training, and DP personnel and users may have to compete for space in the same classes.

Training coordinators at SAS and Information Builders both report that their courses for end-users are in greater demand than those for DP. Even before they know how they are going to use such products, users are calling their training coordinators to request enrollment in the next class. The DP ego, previously secure with its technological mystique, is now confronted with the eagerness and ease with which users are acquiring programming skills.

And users are not shy. In the absence of DP support, they will go directly to the vendor for assistance. Vendor hotlines report receiving calls from total novices — evidence that given the opportunity, users will find a way to learn.

Users and DP may also have to compete for machine cycles and file space. To paraphrase Parkin-

son's Law, user needs expand to fill the resources available. IBM's not-so-subtle objective of selling hardware via the marketing of its information center concept has been successful. The amount of computer power and disk space in demand by users, and the number of such users making these demands is rising rapidly.

As Mike Dundov, Information Builders' customer support manager put it, with tools as powerful as Focus, people can really "go berserk" and build systems rapidly. "This is terrific for user productivity," he pointed out, but cautioned that it has an impact on computer capacity. Systems programmers are having a problem controlling this growth and the inefficient code produced by users, according to Dundov. "There is always a more efficient way of building a system," he observed. Vendors are starting to place more emphasis on documenting efficient techniques to aid both programmers and users.

At the Polaroid Corp. information center, a charge-back system is in use which encourages user involvement, motivates user efficiency, and ensures a fair allocation of a limited resource. But with charge-back still far more the exception than the rule — to judge from a poll taken at a recent information center manager's meeting — users have no financial incentives to restrain their demands. One manager described a user who requested 10,000 tracks of disk space "just so I'll be prepared in case of anything."

While losing some of their former control over mainframe use, DP is actively attempting to assert control over microcomputers. Most DP installations have developed policies and guidelines governing the choice of microcomputers to be purchased. Some, such as Liberty Mutual Insurance Co. in Boston, have also placed strict controls on the personal computer software a user may purchase for business use. Not only must the user go through DP to meet its $250,000 mainframe needs; it must also obtain DP approval for a $250 spreadsheet package.

In practice, however, complaints are few. Blue Cross of Rhode Island appears to be a typical case; although it has a committee which rules on user requests for personal computer software, approval for purchases is rarely withheld. Instead, reviewing a user's choice provides an opportunity to make recommendations that may be in the user's best interest.

Users are not letting these rules and regulations hold them back. They are, in fact, spending their lunch hour at the same computer stores as DPers. Although it's still possible to distinguish technically oriented customers from novices "in the first 20 seconds," according to Lafayette Bingham, manager of Microsource Financial of Boston, the level of computer sophistication is rapidly increasing. With computers becoming more accessible to end-users, according to Bingham, they are exhibiting "a lot more awareness and acceptance of computers and a lot less paranoia." Microsource Financial now finds that its software-specific classes are beginning to outdraw those in personal computer fundamentals.

Microsource, Computerland and vendors serving corporate accounts view DP as receptive to the growing microcomputer sophistication of users. A marketing consultant having frequent contact with DP departments and personal computer coordinators had a different view. In discussing the rapid proliferation of personal computers through many companies, he noted: "On the one hand, DP is complaining that the whole thing is out of control, that it is creating chaos everywhere. On the other hand, they are pleased because these personal computers are relieving some of their workload."

It is the personal computer coordinators, however, who have to deal directly with this proliferation and with the eagerness of users who view personal computers as the solution to all their business needs. This eagerness is epitomized by the user who calls the personal computer coordinator and says "I want to buy a personal computer and download."

From the perspective of the coordinator charged with developing an integrated set of plans and policies, the situation is just a bit more complex than that. It involves corporate policy, DP guidelines, personal computer compatibility, network installations, software support options, downloading limitations, data confidentiality and numerous other policy and technical issues. The user reaction, however, is that DP is again making excuses to keep users from getting their jobs done.

And the cycle continues.

As Dr. Michael Hammer, an authority on the strategic implications of new information technologies, has observed: "Greater availability of information will lead to new distributions of power and responsibility in the organization." These distributions of power and responsibility bear directly on the user-DP relationship.

Both users and DP are moving quickly to adapt their strategies, policies, organizational structure and support mechanisms to cope with the advent of "users as programmers." And just as the information center is stabilizing in many companies, even newer approaches to end-user computing support are beginning to emerge — the Intelligent Information Center (a Computer Corp. of America concept), the Personal Productivity Center (a Hewlett-Packard Co. concept) and the Decision Support Center from IBM, to name a few.

So where is the user-DP relationship heading? As with every other major change in DP, nobody knows. Stay tuned.□

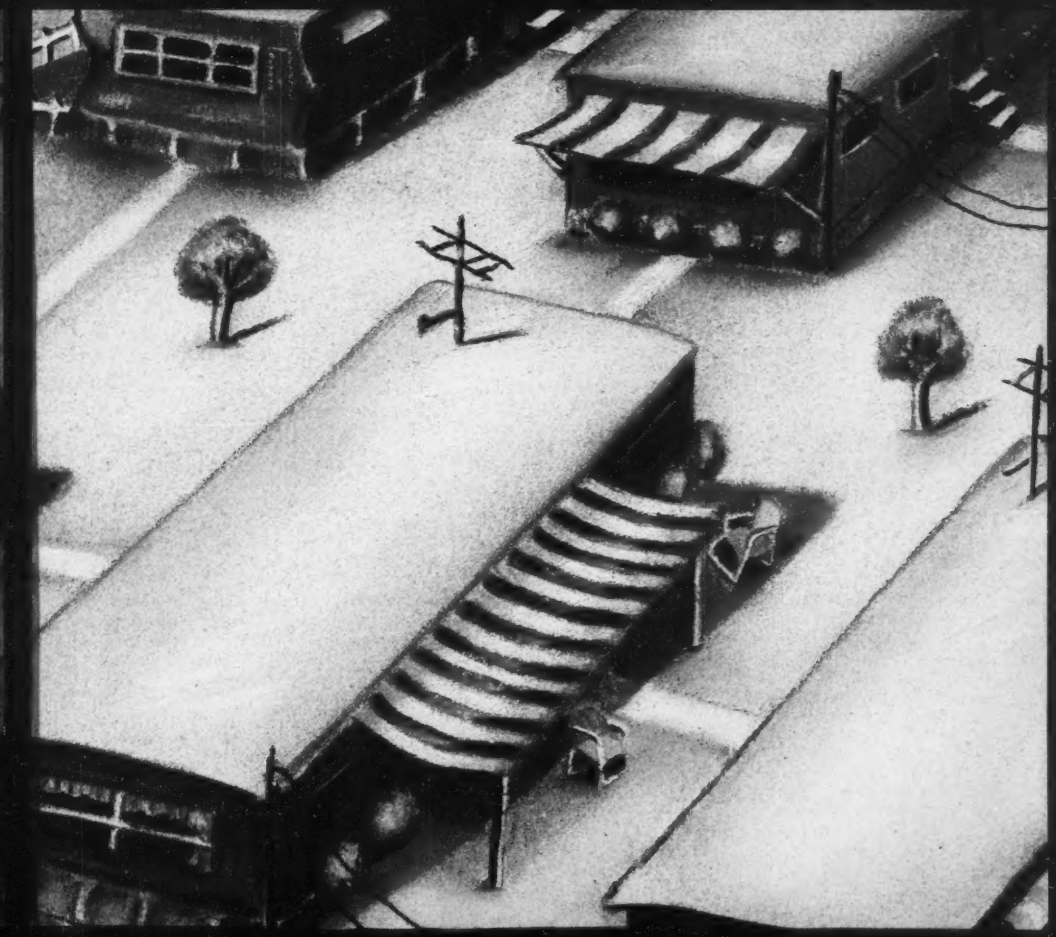
# Moving In

By Paul Gillin

No software technology has ever commanded the attention of the corporate data processing community as quickly as the microcomputer-to-mainframe link. For more than a year, it has been one of the industry's hottest subjects. Surveys say virtually every Fortune 500 firm is implementing or planning to implement a tie between its vast new body of computer users and the closely guarded corporate data base. And vendors sensing a gold mine have been turning out a dizzying number of announcements.

Yet the parade of products has obscured what appears to be a cautious attitude on the part of users. Indications are that relatively few installations have done much more than test the technology in-house and even fewer have implemented it in a production environment.



ELISA TENENBAUM

# *Micro to Mainframe Link*

Those that have, however, are reporting substantial benefits. According to recent interviews, a willing coalition of data processing and corporate management has been forging the link at most companies. The result has been improved visibility for the DP department, a decrease in the burden on both computer and staff resources, and the emergence of an information systems policy that is truly user-driven.

About 100 IBM Personal Computers are tied into the mainframe at Beverly Enterprises in Virginia Beach, Va. The billion-dollar company operates about 800 nursing homes around the country, which are grouped into 10 regional divisions and tracked at the institutional, divisional and corporate level. The Information Services Division at Beverly runs IBM 3083 and 4341 processors and is in the process of converting from two NCR Corp. Century mainframes to IBM hardware to run its accounts receivable workload. Beverly uses Millennium financial software from McCormack & Dodge Corp. (M&D) and M&D's Interactive PC Link to tie the PCs and the general ledger software together.

Installing the link has enabled Beverly accountants to track nearly twice as many nursing home accounts

as they could under the old manual method, according to Chuck Guthrie, manager of systems development. Previously, accountants took general ledger reports generated by the mainframe and manually copied data into worksheets for the individual nursing homes. "About 40% of the accountants' workload was maintaining papers and generating analysis," he said. "It was completely manual."

Beverly Enterprises uses Lotus Development Corp.'s Lotus 1-2-3 integrated software on the Personal Computers. The DP department created some canned Lotus models that accountants use to analyze data that is downloaded from the mainframe. Beverly also uses the micros in terminal emulation mode for ad hoc queries and selective extraction for analysis on the micros.

Guthrie estimated payback time on the micro-mainframe link project to be 18 months. Not only has the technology allowed accountants to handle more accounts, it has also cut paper production dramatically, Guthrie said. For example, a detail trial balance report that used to run over 1 million lines has now been eliminated. In addition, the accountants can now view that same information on-line rather than just once per month.

Now the company has installed three of M&D's PC Links at corporate headquarters in Pasadena, Calif., where they will be used for profit and loss analysis, Guthrie explained. Users at divisional headquarters around the country are being tied into the network with IBM's Systems Network Architecture (SNA) boards and will be upgraded to PC Link within a year. When complete, corporate, divisional and individual accounting personnel will be able to extract general ledger data for their areas of operation. Security is not expected to present a problem, Guthrie said. Beverly uses IBM's Resource Access Control Facility security system on the mainframe and Millennium allows security to be defined down to the field content level.

Crane Carrier Co. in Tulsa, Okla. has made installation of a micro-mainframe link a by-product of a much larger move from customized to packaged software. The manufacturer of custom industrial trucks was laboring under the burden of an old in-house financial system running on a Sperry Corp. 90/80 mainframe until 1982. Since then, the company has installed an IBM 4341 running under IBM's MVS operating system, a set of packaged financial and manufacturing applications from Management Science America, Inc. (MSA) and is in the process of migrating its processing entirely to an upgraded 4341 or an IBM 3000 series processor, according to Jim Adelblue, a financial systems analyst.

Crane is using MSA's Executive Peachpak to produce custom reports on the micro from the mainframe's general ledger data. Data is downloaded directly into preformatted worksheets where users in the financial group can produce reports that until recently were typewritten, Adelblue said. The next phase of the project will be to apply the Business Graphics module of Executive Peachpak to create summary graphics of financial performance. Graphs will depict such relationships as debt ratios, assets-to-liabilities ratios and current liabilities to long-term liabilities. Graphics have never before been used in standard management reporting at Crane, Adelblue said.

Crane plans two other uses of micro-mainframe communications by the end of the year. The first will be to replace its IBM 3279 terminals on the factory floor with IBM PC-XTs tied into Comserv Corp.'s Advanced Manufacturing Accounting Production System (Amaps) on the mainframe. Users will be able to generate reports locally from downloaded data as well as create inquiry screens that can be uploaded to Amaps.

"On the micro we'll do standard tracking reports to measure performance against goals," Adelblue said. "Now this can only be gotten from a 300- to 400-page document. We can reduce this to five or six pages at the PC level."

Later this year the company will also begin to develop local-area networks at its Depot retail parts stores. The stores will use the micros for local transactions and upload that information to the mainframe via leased-line and dial-up communications. The stores will also be able to access the mainframe on-line for parts available inventory, cash availability and other operating information. Because the retailers now use on-line terminals, Adelblue expects to reap at least a 60% savings in communication costs with the new network.

Personal computers are nothing new to customers of Direct Merchandising Services, Inc. in Mount Prospect, Ill., which handles data processing support for direct mail companies. Direct Merchandising Services maintains customer accounts and mailing lists for its clients. But to update that information, clients still have to fill out coding sheets and mail them to Mount Prospect for entry into the mainframe, according to Mike Moran, manager of systems and programming.

Direct Merchandising has begun a pilot program to allow its clients to download information about their customers and mailing lists into their local Personal Computers and produce locally the reports they used to receive in the mail. The company uses a new product called PCMainframe from CFSoftware, Inc. of Chicago.

In its first use of PCMainframe, Direct Merchandising has taken sales data for selected clients and loaded it into IBM Vsam files. Clients can dial into the mainframe and download individual records, summaries by product and mailing list and summary totals into a variety of spreadsheet packages on their Personal Computers. Security is defined by "profiles" on the mainframe which define the types of access allowed different clients

## Management Pushing Links

No data processing manager is likely to tell you the microcomputer revolution has been easy to handle. However, those who have responded quickly to the need to link the small machines to their corporate mainframes say that not only has their department's visibility increased, but their workload has eased as well.

Unlike most information systems milestones of the past, the micro-mainframe link was not the product of DP incentive, according to managers who were interviewed. Almost unanimously, the managers said the idea was put forth and nurtured by upper management.

Accountants at Beverly Enterprises in Virginia Beach, Va. adjusted to the introduction of a micro-to-mainframe link there "by dictate," according to Chuck Guthrie, manager of systems development. Beverly Enterprises has grown almost five-fold in the last five years, prompting the vice-president of accounting to demand an increase in efficiency. "We gave him his own micro and he began building his own spreadsheets," Guthrie said. "He said we had to find a way to be more efficient. In fact, he helped to build, prototype and test" the micro-mainframe communications project at Beverly.

At Crane Carrier Co. in Tulsa, Okla., "The person we got involved first was the chief financial officer," said Jim Adelblue, financial systems analyst. "He was our first user and our best salesman. We had no resistance, not even in the beginning, because we started at the very highest level."

"Management knows traditional tools won't hold up in the 1980s," said Bob Calicchia, director of information systems services at American Television and Communications Corp. in Englewood, Colo. "It speaks well of them that we've been pursuing [micro-mainframe link] tools for the last six months." Calicchia said that in fact, management information systems (MIS) has been split into two groups, one focusing on application development and the other looking for productivity tools, including micro-mainframe links.

"Actually, I got a push from my management for this," said Tom Chapman, senior vice-president and director of MIS at CCA Financial Management Corp. in Dallas, which recently installed McCormack & Dodge Corp.'s PC Link. "Usually I have to fight. I back-doored this in that I had to alert management to the availability of PC Link, but the VPs have been very excited about it."

and the records that can be downloaded.

Initial reaction to the experiment has been enthusiastic, Moran said. "Everybody supports it," he said. In addition, the low cost of PCMainframe relative to packages like M&D's PC Link, "brings this capability within reach of the smaller guy," he added.

Moran hopes to use the link for two other major activities. One would allow clients to prepare customer information on their PCs and then update their master files over telecommunications lines. "We'd like to distribute responsibility for maintenance functions back to the clients," he said. The other would replace the company's on-line telephone order entry system with Personal Computers. Currently the system runs under IBM's CICS. "That necessitates that we keep CICS up 24 hours a day, seven days a week," Moran said. "If we can duplicate that data on the PC, we could upload only when necessary. We wouldn't have to keep CICS up all the time."

A similar application is being run at American Television and Communications Corp. in Denver, where a link is being used to cut paperwork for the 1985 budgeting process. American Television and Communications, a wholly owned subsidiary of Time, Inc., operates 130 cable television systems across the country. As many of its subsidiaries began bringing in micros independently, corporate data processing sensed an opportunity, according to Bob Calicchia, director of information systems services.

The company had always prepared estimated budgets for its subsidiaries by sending estimates back and forth between the local companies and corporate headquarters. Budget estimates were keyed into the company's Software International Corp. General Ledger package in Denver. The process was a "repetitive process of trial and error in which the major responsibility of entering data was the corporate headquarters'," Calicchia said.

The company recently installed Tempus-Link from Micro Tempus, Inc. of Montreal and tied a number of subsidiaries into the corporate mainframe via multidrop leased-line communications. Field locations can now download budget estimates for the next year, manipulate the information on Lotus 1-2-3 and upload it to the mainframe. The estimates are processed there in batch and revised estimates can be downloaded again, Calicchia said.

American Television expects to have about 50 Tempus-Link users by the end of this year. The project has met with widespread approval among the field locations, many of which have suggested further uses for the product. The principal benefits of Tempus-Link will come from its file-sharing feature, which uses virtual floppy disks on the

mainframe, according to Ken Cagle, a consulting analyst. "It may be used to share in-house developed programs or templates," Cagle said.

Calicchia added that the virtual floppies are an inexpensive alternative to local disk storage. "If you need storage for your PC, rather than spending $2,000 for a 10M-byte disk drive, you can run virtual diskettes on the mainframe," he said.

American Television had previously used Technical Analysis Corp.'s Irma board for file transfer and found that Tempus-Link was "a lot more efficient," Calicchia said. However, the product has required modifications to make it more "executive-friendly." These included changes to some CICS commands to make Tempus-Link easier to use and the addition of routines on the mainframe to allow records to be downloaded selectively. "Tempus-Link doesn't have any intelligence as far as picking what you want to download," Calicchia said. "It's just a conduit."

The link could soon be used to relieve the burden on CICS, he added. "We believe we can use it to download spooled reports to divisions at off-peak times," Calicchia said. The DP department has developed routines that "wake up" the Personal Computer at off-peak times and download reports. The feature will allow field locations to print their own reports locally, rather than tying up print spoolers under CICS, he said.

With about 750 IBM Personal Computers in use in the New York area alone, Peat, Marwick, Mitchell & Co. has one of the most sophisticated micro support departments of any firm. A four-person personal computer department within the computer resources department handles all purchasing and maintenance in the New York area.

The company uses Cullinet Software, Inc.'s IDMS data base management system on an IBM 3033 mainframe running both VM/CMS and MVS and extracts selected data from it on a regular basis. The data is loaded into IBM's APL/DI data base management system and made available to Personal Computer users for download. The company uses VM Personal Computing, Inc.'s Please package on the mainframe and Relay package on the PCs to accomplish the transfer.

Users are primarily partners in the company and their staffs who perform budgeting, forecasting and modeling on the Personal Computers using the extracted data, according to Personal Computer Department Manager Bill Ryan. Security is provided through CMS passwords which are handed out selectively and changed periodically. Also, the data being used is "not particularly sensitive," Ryan added.

Ryan said the Please/Relay combination allows data to be selectively extracted on the mainframe using keyed fields. The data is then transferred in a format that can be loaded over asynchronous telephone lines into popular financial software on the micro.

A useful feature of Please/Relay is its Digital Equipment Corp. VT100 terminal emulation facility, Ryan said. This lets the Personal Computer access the mainframe production data base through a protocol converter to emulate bisynchronous communications. "It fakes out the mainframe into thinking it's talking to a[n IBM] 3270," he said.

Ryan lauded the ease-of-use features of the communications software. "It has a super text editor for one thing, and can even do sorts," he said. All of the keys on the micro are "soft," enabling command or script files to be invoked easily through programmed function keys that can vary with the application.

The personal computer department has enhanced the user friendly features by writing a set of script files that perform much of the mundane work of hooking into the mainframe, Ryan said. The routines take advantage of a Relay feature that emulates concurrency on the Personal Computer. For example, one regional vice-chairman dials into the mainframe and types in an account code, Ryan said. He then pushes a programmed function key that executes a script file to bring up a menu giving him selection criteria for mainframe data. The user specifies what information he wants and the software generates a command file that is uploaded to and executed on the mainframe. The file extracts the data and downloads it to the Personal Computer. "While that's going on, he can print a file on the PC and also run any other program he wants," Ryan said.

Some users have even written script files themselves, Ryan continued. One partner has written a routine that enables his office computer to dial his home computer in middle of the night and download files into it for perusal in the morning.□

# Software Contracts Revealed

By Thomas K. Christo

*As recent articles in the popular press have pointed out, software is the main focus of today's data processing industry. Scores of new software companies are springing up every month, particularly since the only significant capital investment necessary for the creation of software is an innovative mind. Thus the significance of software acquisitions — and the contracts by which they are licensed or purchased — has changed substantially from the days of the "bundled era" when software, if it was mentioned at all, was simply referred to as an afterthought in one or two lines of a hardware lease or purchase agreement. This overview will highlight some of the areas of concern to both the user and the vendor when they embark upon negotiations for acquiring software.*

SHARON MONAGHAN

A contract is defined as a meeting of the minds, where each party to the agreement gives up something of value. It can be a very informal document or a purely verbal agreement evidenced by some perfunctory writing. However, no matter how laborious and detailed the contract document is, it is important to realize that any contract

cannot enforce itself. In other words, despite all the wonderful clauses you have in an agreement which protect you or specify precisely what kind of product you are getting, or no matter how many marvelous rights to payment and remedies upon default of payment you may have devised, if either party chooses not to live up to the contract terms, the aggrieved party will still have to resort to some legal tribunal to enforce his remedies.

***If the application involved is a particularly limited one, embodying only a very small facet of the business, a limitation on liability may not be of particular concern. On the other hand, if you are acquiring a multiple-module software package that will control almost every part of your business, its failure to operate as proposed may literally drive you out of business.***

This perhaps explains why the majority of data processing contracts bear very little (if any) rational relationship to reality. The typical data processing contract is a preprinted affair consisting of legalese, generally designed to protect the vendor, which is written in vague, all-encompassing language that is not particularly applicable to any specified product. In the event of any meaningful dispute between the parties as to who promised what and what was delivered, a legitimately aggrieved user will generally be able to prevail on a theory of fraud, negligence or both and have the onerous contract language ignored. A vendor, on the other hand, will often be able to hide behind the exclusionary clauses in a preprinted contract and avoid liability in all but the most troublesome cases.

Given this state of affairs, why would one bother to write an article about software contracts? The answer is deceptively simple. The contract itself is really not very important. It is instead the process by which you arrive at a contract which has meaning and real objective worth to each party. Ideally, once you have negotiated an agreement, both parties ought to be able to put it in a drawer and never look at it again. Through the process of that negotiation, however, vendor and user have hopefully educated each other as to what they are willing to deliver and not deliver, what it will cost and what each party's expectations are. After such a negotiation, both parties can then conclude the deal with truly open eyes. Thus, although a legitimately aggrieved user could get redress in the courts if he was defrauded or treated in a negligent fashion, notwithstanding the preprinted contract, he would have been far better off to have learned the shortcomings of the product and what the vendor was really willing to deliver during the negotiating process.

Similarly, although the vendor could often avoid liability in all but the most flagrant of situations through the use of his preprinted contract, he too would have been far better off to highlight to the user precisely what risks the vendor was willing to undertake or not undertake during the negotiating process. To the extent that the vendor's contract also legitimately addresses the particular product he is selling and what he has promised and not promised, that vendor will also be better off in avoiding some, but not all, liability in the event of some future failure of performance. In some cases, because the vendor contract is a preprinted affair not addressed to the particular software product, it is more easily ignored by the courts in favor of a more logical and realistic approach to the problems that arise. Before turning to the negotiating process, it might be helpful to highlight some typical vendor-requested clauses and their meaning to a software contract.

A warranty, or promise that a product performs in a specified way, may be described in writing in a contract. Even where no such warranty is specified, the law will imply such a promise that the software is fit for a particular purpose. However, most preprinted software contracts include a disclaimer of all warranties, including the implied warranties of merchantability or fitness for a particular purpose. In effect, the vendor is telling the user that he must take the product on an as-is basis, with no promises whatsoever as to its suitability in his environment or as to the performance of any particular function.

### Warranty Exclusions

Such contracts either exclude vendor liability altogether in the event of software nonperformance or limit an award to a nominal amount, such as the software's purchase price. In the absence of such a limitation, a failure to perform could make the vendor liable for lost profits, excess expenses, cost of replacement software and other damages the user might have suffered because of the failure of the software delivered under the contract. The purpose of this clause is to limit the vendor's liability and the user's right to recover damages actually suffered in the event of a failure or failures of the software product.

A software contract will typically provide that the purchaser may only use the product for his own company and not sell or otherwise transfer ownership or allow use by nonpaying third parties. It also often provides that only object code and user manuals will be furnished under the agreement, thus making modification of the software all but impossible — or at least it specifies that any modifications made to the product by or on behalf of the purchaser shall become the property of the vendor. These clauses protect the vendor's valuable intellectual property right in the soft-

ware, and permit that vendor to sell the product to other parties at a profit. Obviously, if there were no restrictions of transfer or modification, a user could either resell the product to third parties in direct competition with the vendor or modify it and then resell it, attempting to argue that it was a different product.

**Patent-Copyright Indemnity**

A software contract will typically include a clause that requires the vendor to defend any claim of patent or copyright infringement on account of the purchaser's use of the product. This clause also generally requires that the user promptly notify the vendor of any claims of copyright or patent infringement that the user discovers and specifies that the user must allow the vendor the sole and complete right to defend any legal action caused by such claimed infringement. This is required to ensure that the user will not, through inadvertence or other means, botch any valid defense to a claim of infringement and thereby compromise the vendor's rights to sell the product.

Most vendor-supplied contracts specify that the written document is "the entire agreement between the parties, which may not be altered, amended or revoked except in writing duly executed by parties or their representatives in similar capacities as those who signed this agreement." In other words, the written contract encompasses the entire deal between the parties, to the exclusion of everything else. These clauses often also include an express statement that all prior proposals, letters, correspondence or representation are explicitly excluded and superceded by the written contract. This provision is generally inserted in the contract to protect the vendor from an overzealous sales team that may have proposed or promised more than can really be delivered. In more nefarious situations, it is a type of legal doublespeak through which the vendor attempts to propose and sell a specific solution to the user's needs and then, in a written agreement, disclaims any and all liability, promises or representations that the product, when delivered, will indeed meet the solution as originally proposed.

Of course, "the totality of the agreement" clause is not onerous in and of itself — if the agreement contains all of the promises and representations concerning the product which you expect. On the other hand, if the agreement contains some of the exclusions and limitations mentioned earlier in this article, the totality-agreement clause may be viewed as a final nail in the coffin.

Since the previously described clauses may appear drastic to many users, it must be reiterated that contracts cannot and do not enforce themselves. Once again, if a party has legitimate and serious grievances with a product due to vendor misrepresentation, negligence, deceptive trade practices or bad faith, the user will invariably be able to obtain relief despite what the contract may say. However, the objective of the negotiating process leading up to the contract is to minimize the occurrence of or need for litigation by identifying problems before they become problems. Therefore, keeping the import and effect of these clauses in mind, let us consider that process.

Before sitting down with the vendor to negotiate a contract for the purchase or license of a software product, it is advisable to list all items which you want to see in that document. Do you want promises of specific performance or warranty to overcome the limitation and exclusion of warranty clause? Do you want the right to collect various types of damage if the software does not work properly? Is there a need for the source code or a right to modify the software? Do you want to refer to prior proposals or correspondence in the contract to insure that what you were promised is what the vendor will deliver? Obviously, the list goes on, depending upon the particular circumstances. Once you have created that list, you should order its elements into three categories: those you must have, those which are optional but desirable and negotiating ploys which you will concede if necessary. In order to determine in which category each of the elements on your list will fall, there are three factors that you first have to consider:

***Know your needs.*** You must determine precisely what you hope to accomplish with the acquisition of this software product. If the application involved is a particularly limited one, embodying only a very small facet of the business, a limitation on liability may not be of particular concern. On the other hand, if you are acquiring a multiple-module software package that will control almost every part of your business, its failure to operate as proposed may literally drive you out of business. In this situation, the limitation of a liability clause should be of considerable concern. Similarly, if you absolutely must have this software product functioning as proposed in a relatively short period of time, some specific warranty of the product's characteristics might well be important to you. On the other hand, if you have the luxury of a leisurely installation and testing phase before you have to put the product into productive use, you may be able to determine whether or not the product performs as warranted — so that a specific warranty on its usability is really beside the point.

***If a vendor with few assets defaults in some meaningful way and causes you damage, you may end up owning a couple of old wooden desks and a five-year-old Mercedes that the president used to drive.***

***Know the product.*** If you are acquiring a software product that

has been in use for several years in similar environments at hardware installations similar to your own, many limitations and disclaimers should not be of particular concern to you. This is especially true if you have had an opportunity to discuss the product's characteristics and deficiencies with a number of other users. On the other hand, if you are buying a relatively new product, or are contracting for

***It is the process by which you arrive at a contract which has meaning and real objective worth to each party. Ideally, once you have negotiated an agreement, both parties ought to be able to put it in a drawer and never look at it again.***

the creation of a software package, some kind of warranty that it will perform as proposed is particularly relevant. Failing the presence of such a warranty, a built-in testing period and parallel operation phase appropriate to the application is a necessity. This allows you the absolute right to cancel the contract without obligation if the software does not live up to the test. In many cases, a suitable fallback position could be a warranty that the product as delivered will at least conform to the vendor's then-published specifications about the software. Of course, this limited warranty is only effective if there are published specifications and if you have read and understood the specifications as embodying what you are looking for in a software package.

***Know your vendor.*** Many software vendors these days are capitalized on a shoestring. Software companies spring up overnight and are gone just as quickly. Thus, if you are dealing with a relatively small or new software company with skimpy assets, a no limitation of liability provision in the contract is of little or no consequence. This is so because, at best, if the vendor defaults in some meaningful way and causes you damage, you may end up owning a couple of old wooden desks and a five-year-old Mercedes that the president used to drive. In this case it would be far more important to demand the right to source code and the hiring of vendor personnel to modify or fix that source code if the vendor becomes insolvent, goes out of business or materially defaults on his obligation to deliver the product. Alternatively, it is a very good idea to demand that an updated, current version of the source code for your software package is stored in escrow with a mutually convenient third party (for example, a bank) and may be recovered on demand in the event of bankruptcy or insolvency of the vendor.

On the other hand, if you are doing business with a major vendor, you can feel relatively secure that the company is not going to go out of business tomorrow and should concentrate instead on exacting as many financial concessions and performance promises as the vendor is willing to agree to.

Armed with your list ranked according to the three categories suggested, and after you have considered your needs, the product and the vendor, you are now ready to sit down with a vendor representative and hammer out the agreement.

Always keep in mind the contract you will generate as a result of the negotiation is quite beside the point. What is significant is each party's response to the demands made by the other. Thus, in a negotiating session you may learn for the first time that the vendor really is not willing to commit in writing various glowing predictions about the software's capabilities and performance that were previously specified in the proposal. In some situations, this may well give you pause for thought and cause you to back out of the whole deal. At the very least, such a revelation should be a signal that you are dealing with a party that, for whatever reason, is not willing to sign a contract with you to deliver what was glibly promised during the sales effort. In effect, you should view the negotiating process as a means of determining the vendor's true motives and intent before you commit to buy the product and attempt to use it. Another key method for accomplishing this goal is the manner in which various terms are defined in the agreement.

It is a good idea to start the contract with a heading entitled "Definitions," which attempts to specify the meaning of each DP term in simple, nonlegal and non-DP English. In the data processing business, many people hide behind jargon and its somewhat imprecise meaning to evade the true issue. Similarly, many a lawyer has hidden behind legalese to mask his client's true intent. The extent to which a vendor is willing to commit promises to simple, clearly understood language is a very effective barometer of his true motives and good faith. For example, a software package could simply be described as "the XYZ General Accounting Package, and User Manual Therefore." On the other hand, it could be defined as "The XYZ General Accounting Package as Specified in a Proposal to Utility User dated January 3, 1984, which proposal is attached hereto and incorporated by reference herein, and all manuals, documentation and other explanatory literature describing the package, its components, the use and maintenance." Obviously, the latter definition is far more desirable, particularly if the proposal which induced you to enter into the negotiations accurately sets forth the solution you expect to meet your needs.

Many software products today are being touted as compatible with the hardware or software of one or another particular vendor. However, what does compatibility actually mean? A lot of disgruntled purchasers have learned the term may mean the software package purchased is written in the same

# Over 114,000 microcomputer hardware prospects will look for you starting this September when you advertise in the most-used guide on the market

The **Computerworld Buyer's Guide to Microcomputer Hardware** will be mailed free to over 114,000 domestic *Computerworld* subscribers. We expect this guide to be one of our best-received and most-used issues ever.

Why are we so confident? In a recent study by STAT Resources of Boston (using unaided recall) more than 81% of the *Computerworld* subscribers who purchase microcomputer hardware cited the **Computerworld Buyer's Guides** as one of the references they consult most frequently. No other reference was mentioned by even as much as 20% of those questioned.

## We give buyers what they need in a guide

This issue, our feature editorial will include portables. They're the most explosive segment of a market that's expected to nearly double this year alone.

Readers rely on us for the facts they need to make important decisions on what to buy, and who to buy it from. The data we use are provided by IDC, the world's largest market research firm serving the information industry. So every issue is current, complete, and accurate. And we're constantly updating.

Our guides are easy to use, too. Tab dividers separate each category, and we help users save time by cross referencing every listing.

## Usage is up

All of this means one thing for you. Your ad will get results, because our guides are used. In fact, the STAT Resources study discovered that our subscribers use buyer's guides more now than ever before. Usage is up 10% over just a year ago.

That's not all. Compared to the next most popular guide, three times as many people use the **Computerworld Buyer's Guides** at least once a week.

And over 91% of our readers refer to the guides at least occasionally. That's better than twice the usage rate of our nearest competitor.

## Readers with purchasing power

The people who study your ad are quality readers. After all, they're *Computerworld* subscribers. Professional computer users, senior executives, consultants, and vendors. They're the ones who make the decisions on what to buy.

And starting this September, they'll use the **Computerworld Buyer's Guide to Microcomputer Hardware** to help make those decisions. Can you think of a better time to get your sales message to them?

Call us today to place your ad. Contact your local sales representative; Ed Mareckı, National Sales Director; or Kevin McPherson, General Manager.

standard language as most generally available software products for the specified hardware vendor, but not necessarily that it will actually operate on all or even most of the hardware products furnished by that vendor. Thus, as opposed to a bald statement that the software is "vendor-X compatible," it would be a good idea to demand: "vendor-X compatibility is defined as the ability of the software product to operate on a vendor-X CPU with 128K bytes of memory and one vendor-X 2.3M-byte disk drive."

Software maintenance may mean as little as providing the user with the modifications on the package or as much as responding within a specified period of time to all recorded bugs and correcting them. Thus, it would be a good idea to define precisely what kind of maintenance you expect and to what the vendor is willing to commit. Obviously, the extent of maintenance available influences the desirability of your obtaining a full copy of the source code so you can perform your own maintenance if necessary.

The above terms, although commonly encountered in a software contract, are by no means an exhaustive list. Suffice it to say that serious thought should be given to an accurate definition of each and every item for which you intend to contract and a full discussion of these definitions should occur during the negotiating process.

The software contract in today's data processing environment is in a state of flux, just as the industry itself is in a state of continual change. It therefore becomes all the more important for the parties to a software acquisition to consider and freely discuss what each expects of the other before a contract is written or signed. What each party learns from the other during this process will either negate the deal altogether or insure, insofar as it is possible to do so, that vendor and user alike will enter the deal with realistic expectations.□

# A Trojan Horse For the '80s?

By William H. Inmon

The proponents of relational technology often talk about it as if there were no practical limitations to its application. Certainly user-friendly relational data bases and fourth-generation relational-like software are useful for managing and accessing small amounts of data and transactions where there are many individualized needs. Electronic filing cabinet systems are tailor-made for relational systems. Other legitimate uses for relational software include prototypes and user-friendly systems that must be quickly constructed and quickly changed. The decision support environment (especially on microprocessors) is ideal for relational software. But is relational software appropriate for all environments, particularly the on-line, operational environment?

The reality of relational software is that it consumes a lot of hardware resources when performing on-line operational process-

ing, giving rise to the question "What is the legitimate cost of user friendliness?" It is a common phenomenon to see relational or fourth-generation software installed at a site and watch the hardware budget spiral out of sight, especially if the user attempts to use relational software to build operational systems.

In one case, when relational systems were introduced, the planned hardware budget increase was more than 50% per year over a five-year period. In another case, relational software caused machine utilization to go from one-half of a mainframe to 13 mainframes in a four-year span. In both cases the shops were using relational systems in an on-line, operational mode.

If the user is building nonoperational systems cost-effectively then perhaps the cost of hardware is warranted. But if the user has been told that relational software is useful for all types of processing — when in fact it is ill-suited for on-line operational activity — the question must be asked if the user really is able to judge the cost-effectiveness of the systems produced. There is a tradeoff to be made — the great flexibility and user friendliness of relational software is bought at the price of performance.

Relational systems have (and deservedly so) the image of being very flexible, user-friendly and especially easy to use for rapid development. But there are relational vendors that present relational systems as if they are a panacea for all the problems of DP. In particular, there are those that claim relational systems have the potential performance characteristics to replace traditional performance-oriented, on-line operational systems.

What exactly is the truth of how relational systems have been sold, and what is the reality of their implementation? There is not a more definitive public source on relational systems than Chris Date's *An Introduction to Database Systems*, in which he describes many relational capabilities. Date's book is a wonderful representation of how relational systems are perceived.

The most important issue of performance in the on-line, operational environment is the ability to separate long running activities from short running activities. Once separated, the long running activities are either deferred or are broken into a series of shorter running activities.

In addressing the issues of performance of relational software, Date states that there are controls that can be added onto the relational environment that can separate long running activities from short running activities. Whether or not activities can be separated prior to execution is one question; a different question entirely is whether the user is aware of what this means. In discussions of the many capabilities of relational software there is no mention made of this sort of control.

Furthermore, and more important, vendors are very reluctant to mention the consequences of controls. A quick glance through Date's book will show that the majority of activities discussed cannot be performed if, for example, the long running activities are separated from the short running activities and are either not allowed to execute or are delayed for execution overnight. Vendors do not suggest that using relational software on-line requires a complete change in the nature of the software itself.

As an example of how relational software is presented, most of Date's descriptions of relational operations require data base scans. This means that the richness of the relational operations is significantly diminished if there is a need to separate long running activities from short running activities.

One alternative to long data base scans is to create indices on nonkeyed data fields. Of course one can argue that everything in the data base should be indexed, thereby reducing the need for large data base scans, where an entirely different set of performance problems arises.

So it is true that relational systems can provide a reasonable amount of on-line performance if the relational operation set is severely limited. But proponents of relational systems make either no mention or, at best, scant mention of this limitation. Instead the relational environment is presented as if there were no practical limitations. If limiting the majority of the operational set is not a practical limitation then one wonders what establishes a practical limitation.

These advocates present relational software as if there is full freedom to use relational operations, with no mention of restrictions that arise when going to the on-line, operational environment. Therefore it is entirely appropriate to discuss relational systems as if there were no controls, since that is how the systems are being sold to data processing installations.

A common argument by relational vendors is that there is no requirement to mix the two activities in a relational system, but if one is to use the full relational system — as it is presented to the public — there certainly is a requirement.

In one article Date points out that there is a very real difference between the physical and logical constructs of relational systems. In particular, mention is made of the fact that a user can view the data one way — in individual tables, for example — and have the data physically organized another way — perhaps clustered. This is claimed to be one of the keys to relational systems performance.

Now what exactly does that mean? Consider the upper graphic in Figure 1 on page 45, where three table data bases are physically separate. Even though the data bases are logically related, if they are accessed in the same transaction they will be inefficient to process, requiring heavy I/O. The relational strategy for performance is to cluster the data. This means the data can be physically congregated so that retrievals of the data are

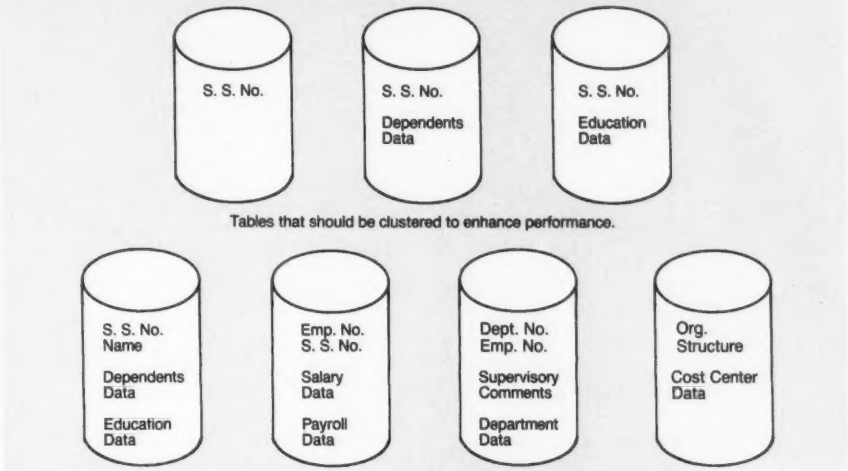

**Figure 1**

more efficient. This is how hierarchical systems are commonly stored. There is no doubt that this will enhance the performance characteristics of the data base shown, but the question is how far can this clustering process go? Consider the data bases shown in the lower graphic in Figure 1.

In that diagram, several data bases are logically related — meaning that a dynamic relationship between the data bases is able to be formed. A relational user can easily use the dynamic relating capabilities to connect the data bases. But the data bases are physically stored separately, so I/O and performance becomes a problem when dynamic linking is used. At this point is it suggested that all the data be reclustered? Surely not, as a whole new set of data management problems arise when large amounts of primarily unrelated data are physically stored together.

But is there any hint that the data should not be dynamically related by the relational software? No, there isn't, because that is one of the selling points of relational data bases. On the one hand data should not be further clustered for a variety of reasons, and on the other hand the user cannot be restricted from dynamically connecting the data. If the user does connect the data as is advertised, the result is poor performance, even with the capability of clustering.

Clustering allows data to be physically optimized once, meaning there can be one and only one physical representation of data, but there are no such limitations on dynamic joining of data assuming the data can be joined at all.

The performance issue remains. Relational clustering of data has at best limited usefulness in addressing the problems of performance because data can be physically clustered into a single configuration but can be logically joined many times and in many ways.

This implies that the performance of the logical use of relational systems is closely tied to the physical underpinning, since relational spokesmen freely advertise relational software as being able dynamically to connect data. The freedom of the connectibility of data is bought at a price, however strongly the relational vendors suggest that it isn't.

One curious claim of the relational vendors is that the mind set of the early pioneers such as Codd and Date is not one of a "batch mentality." The pioneers reply that their goal is to get data in front of the user interactively. But the difference between interactive and on-line seems to have been lost somewhere. IBM's Time-Sharing Option (TSO) is interactive and batch-oriented. IBM's Fast Path (FP) is on-line and is anything but batch-oriented.

TSO is used primarily in a de-

velopment mode. FP is used to drive fully operational banking, manufacturing and industrial systems. When relational systems are used in their nonrestricted mode — occasions where long running transactions are freely mixed with short running transactions, as presented to the user — then relational systems take on the characteristics of TSO. When long running transactions are not allowed into the job stream — thereby severely limiting the operational set of a relational system, something not advertised to the user — then relational systems begin to perform like an on-line system, but are still significantly less efficient than something like FP.

Another interesting claim by the relational vendors is that user requests for resources can be analytically determined prior to the execution of the transaction. By looking at the transaction they claim that they can determine the length of execution and the resources utilized. Of course one question is, even if this can be done, how long does it take to analyze every transaction? In any case, it is questionable as to how accurate this type of prediction can be.

Certainly, requests that use large amount of resources can be tabbed fairly easily, but the simplest request may require an indeterminate number of resources based on such things as data structure, index structure, position within the data base and so on. If a crystal ball subroutine is so well informed as to know these things, it must require an inordinate amount of resources when executed for every transaction and every data base update. One doubts that such gazing into a crystal ball is either effective or efficient, even if it can be done.

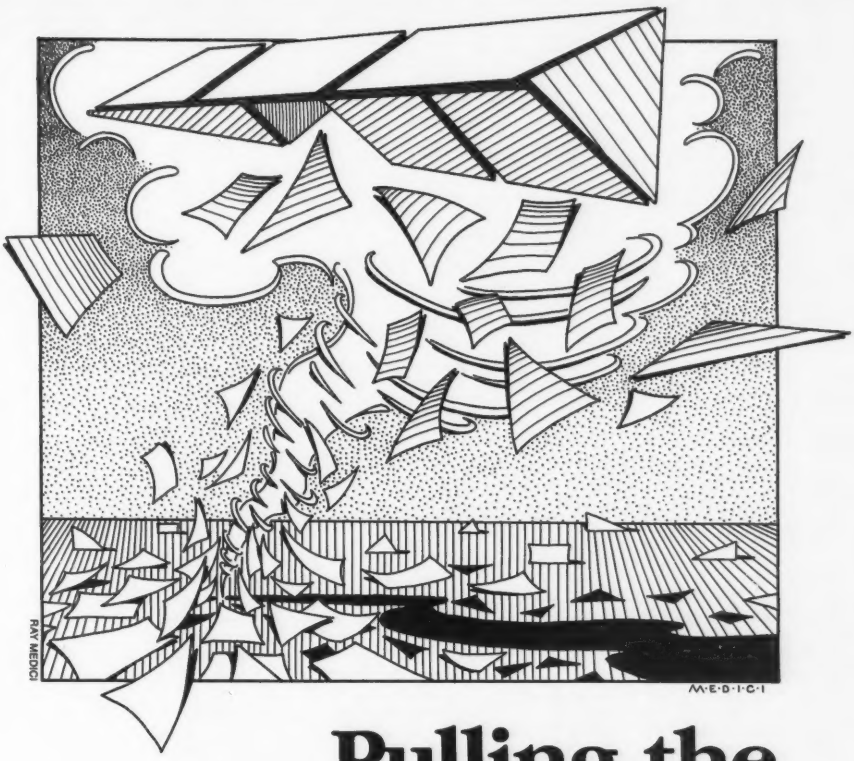
Relational vendors make a point that relational systems can be used in operational and other modes if there is an ample supply of hardware. It is true that if there is an abundance of hardware, then relational, operational performance may be adequate. However, the same hardware could be used much more efficiently by software whose purpose it is to run on-line operational systems. If there is no concern for the hardware budget, then this mode is acceptable.

Another claim by the relational vendors is that hierarchical, or nonrelational-based systems, are not appropriate for ad hoc query activity. While it is historically true that commercial nonrelational DBMS have been poor choices for ad hoc activity, it is conceivable that a nonrelational DBMS could be commercially introduced that would serve the ad hoc needs of the user community. Furthermore, such a DBMS might enjoy significant performance advantages over relationally based DBMS. There is no reason why a hierarchical or network system cannot be used for ad hoc processing, although historically this has not been done.

The issues that are being discussed today are reminiscent of the early days of on-line systems. In the early days of on-line systems there was an emphasis on the speed of building systems. But as soon as the on-line systems began to execute any amount of data or any amount of processing, performance raised its ugly head. The knee-jerk reaction was to throw hardware at the problem or to try to tune performance into the system. But throwing hardware at performance was costly, and tuning on-line applications was only marginally effective. The conclusion was reached that consistent, satisfactory on-line performance had to be designed into the system.

Relational systems are truly elegant in the rapid development of systems and in their flexibility. But once performance becomes an issue, relational vendors say that performance can be tuned or can be purchased by hardware. The fallacy of those approaches has been learned long ago.

There are other approaches to using relational techniques in the on-line, operational environment. Currently, when relational software has been used in the on-line, operational environment it has been run on a single, large mainframe or a complex of large mainframes. Another approach is to run on-line, operational systems on a series of microprocessors. Tandem Computers, Inc.'s NonStop TXP and Teradata Corp.'s Ynet are examples of this approach.



It has been suggested that information processing professionals who decry new technology are standing in place waiting to be declared obsolete. It might be suggested that there is another perspective.

There is a train of thought that if a shop just had enough resources and enough technical talent all problems would be solved. The budget of such shops is typically huge. While there are technical solutions for many types of problems, there are a whole class of problems that are ill-suited for technical solutions. Some people, including data base theoreticians and vendors, are always finding technical solutions to all problems. Those data base theoreticians and vendors represent companies with a motivation for selling hardware. But they do not represent companies that must live within a set budget.

Flexible systems serve flexible environments. High-performance systems serve high-performance environments. Suggesting that all that is required is more hardware or a new technology to solve the productivity problems of data processing reflects an attitude of representing, either actively or passively, the interests of a hardware-motivated manufacturer. New technology has its limits — one is economics and another is appropriateness. After all, are cattle shipped to market in an SST?□

# Pulling the Industry Together

By Tom O'Flaherty

Systems software is finally beginning to awaken from what has been a comfortable, if not a deep sleep. Both the products and vendors comprising this segment of the market have remained essentially unchanged during the last decade. Only recently has evolution of the systems software sector begun to accelerate. This evolution is characterized by an integration across previous functional boundaries, including the integration of previously separate system software families and of personal computer and mainframe software.

In the future, so-called systems software will become much harder to define. This move towards technical integration of products will cause a consolidation of vendor product offerings as well as mergers among currently independent vendors.

To fully understand the impact of movement toward integration, it is important to understand the fragmented nature of the systems software market. Small groups of people who invented better mousetraps at relatively low cost have encouraged this fragmentation.

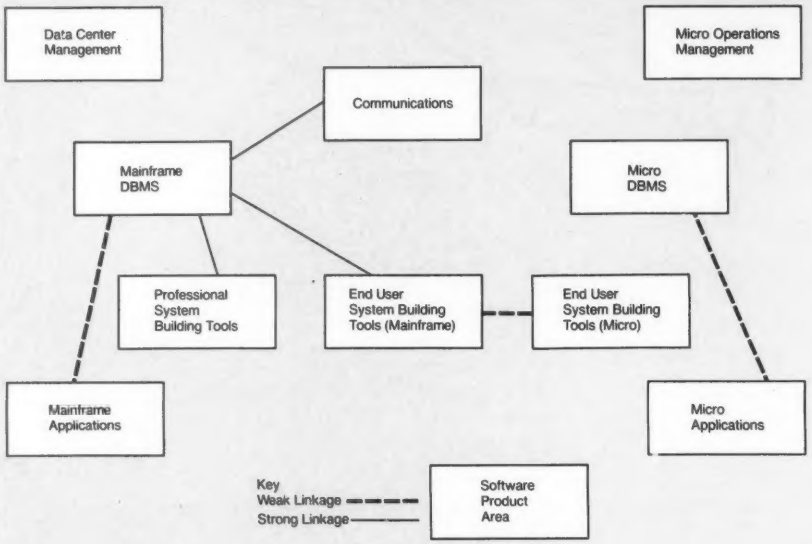

**Figure 1**

Every information processing organization uses system software. This, combined with the technical orientation of both the purchasers and the product offerings led to a specialized niche strategy by vendors. For example, in data center management the slightly different niches in job accounting, performance measurement, capacity modeling or performance enhancement have allowed specialist companies such as Johnson Systems, Inc.; Boole and Babbage, Inc.; BGS Systems; and Duquesne Systems, Inc. to prosper.

Most of all, IBM's lack of dominance in software has enabled specialist firms to produce better solutions to the problems addressed by such IBM products as IMS, sorts, telecommunications monitors and so on. IBM certainly offers the most comprehensive selection of systems software. However, its systems software can be viewed as discrete blocks which, except for the operating system itself, can easily be mixed and matched with software from other sources.

The desire to increase revenues has always been a strong force impelling vendors to expand the scope of their offerings. However, it is interesting to note that many software vendors, especially in systems software, have, until now, often reached a natural limit. The specialized nature of many systems software companies has limited their expansion from both a product development and market awareness standpoint. The data center management software companies are examples of this. The recent withdrawal of On-Line Software International, Inc. from manufacturing software is a case in point — all the more extreme in this case, since the firm attempted to cross the system software/applications boundary.

Even when a system software company does try to expand out of a particular niche, it may have difficulty getting the market to take it seriously. For example, when Syncsort, Inc. offered a documentation aid in an effort to break out of its single-product company category, the firm's advertisements had to state explicitly that its new product was not a sort.

The bottom line is that systems software is itself made up of many atomistic products and firms that have, on the whole, weak links with the personal computer and application worlds. Figure 1 on page 48 shows this situation graphically.

The data base management system (DBMS) vendors are exceptions to this general rule. Their non-DBMS products are natural ties to their DBMS offering. This has several advantages. Users find it convenient to purchase "suites" of products from these vendors. The buying points within an organization for many DBMS vendor

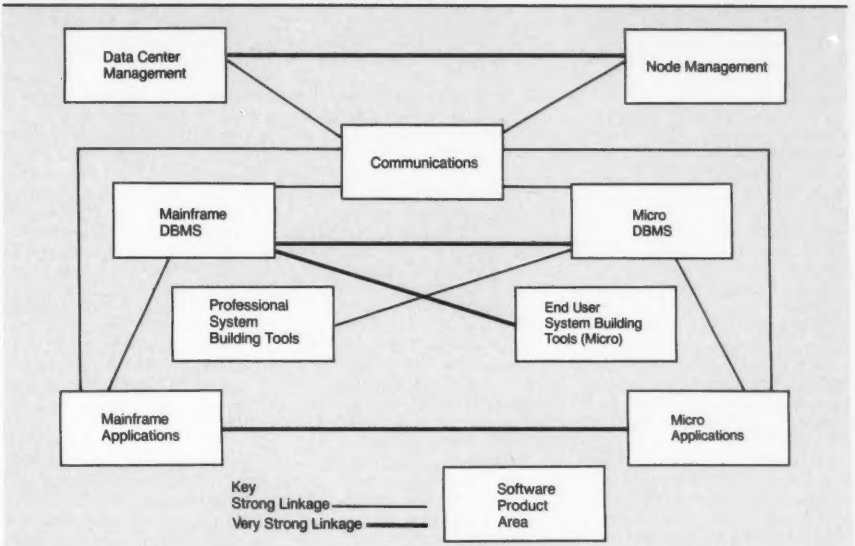

**Figure 2**

add-on products tend to be similar, which makes for better understanding of customer needs as well as for marketing efficiency. Thus, a vendor's technical staff is leveraged, rather than diffused.

Much like the system software market, vendors of personal computer software are highly fragmented. It has been very easy to produce software for personal computers, but it has not yet been proven that even the most successful companies can go beyond the success of their premier product — for example, Visicorp, with Visicalc; MicroPro International Corp., with Wordstar; Ashton-Tate, with DBase II; and Digital Research, Inc., with CP/M. Most personal computer software firms have a very narrow view of customer needs and market directions.

Fragmentation has been advantageous to software users because it allowed them to purchase attractive, specialized products. However, the price paid is a profusion of software products that is bewildering to the information processing professional and utterly mystifying to the neophyte. Selecting and integrating these products is a do-it-yourself task which often has suboptimal results.

Certainly the fragmented profusion of products is a strong argument for integration of product lines. However, environmental changes are now occurring which are generating powerful forces favoring software integration, not just within the mainframe systems software area, but also among systems software, applications software and personal computer software.

The most important of these changes is the acceptance of the micro by corporate America and the belief held by increasing numbers of end users that the microcomputer will free them from the clutch of centralized corporate systems. However, micros will have to be linked in various ways to mainframe systems to make this happen.

Partly in response to the micro challenge, the efficiency of host-based applications development by management information system (MIS) departments must improve by an order of magnitude. This will be an especially difficult task because of the need for information systems departments to adapt to the new micro environment, while at the same time producing applications software that is flexible enough to meet changing user needs. Current and improved application development tools will be a critical need.

### Early Integration

To date, the DBMS vendors have done the most to offer products that are integrated in both a marketing and functional sense. This is partly due to the fact that a DBMS must be accessed and supported by a range of tools to realize its full potential. DBMS prod-

ucts also naturally inhabit a middle ground between applications and data center management and communications.

The DBMS vendors' groups of products often include system building tools for professionals, such as Mantis from Cincom Systems, Inc.; system building tools for end users, such as Natural from Software AG of North America, Inc.; and telecommunications monitors, such as Datacom DB from Applied Data Research, Inc. (ADR).

Cullinet Software, Inc., with its banking and manufacturing systems, and Cincom in its manufacturing system also offer applications that use their DBMS as a foundation for their application software.

There are two areas where there is an increasing integration of products and vendor offerings — micro-to-mainframe data links and end user productivity tools.

Companies that sell mainframe-based software have largely taken the lead in supplying linkages (generally combinations of software and hardware) to enable data to be passed from mainframes to micros and, less frequently, in the opposite direction as well. Two different types of vendors are active here, the DBMS vendors — such as Informatics General Corp., ADR and Cullinet — and the applications vendors — such as Management Science America, Inc. (MSA) and McCormack and Dodge Corp. The products have generally been implemented differently, but typically are set up to allow an extracted and formatted host file to be downloaded to either a widely available micro spreadsheet package such as Visicalc or Lotus Development Corp.'s Lotus 1-2-3, or to the vendor's proprietary micro software tool kit such as those offered by Cullinet and MSA.

These approaches have the advantage (which is perhaps a technical necessity at present) of operating in a controlled environment. It is certainly also convenient for the vendors that their micro-to-mainframe data link software generally only works with their own mainframe software.

However, this proprietary approach will not be feasible in the long run since most computer environments use packages from a number of different sources. Tools that perform these data transfer functions across vendor lines will come into existence to meet these needs. Some are already in the planning or development stage.

Fourth-generation languages are the most notable software productivity tools currently available. These tools, which are geared for both application development and end users can potentially serve as a strong bridge between micros and mainframes (as well as between MIS professionals and end users).

These languages support application development by either building a prototype for later implementation in a conventional language or by actually being used in a production environment. In addition, they are strong bridges between a DBMS and end users since they are either directly attachable to a DBMS through a natural language interface, such as ADR's Ideal and Natural, or have their own DBMS-like qualities, such as Information Builders, Inc.'s Focus, Mathematica Products, Inc.'s Ramis II or Dun & Bradstreet Computing Services' Nomad 2.

However, the best opportunity for integration is where there are compatible (or at least complementary) versions of a fourth-generation language on both the mainframe and micro. Focus is perhaps the most fully developed in this respect, but most other vendors have announced or are testing analogous products.

### Future Integration

There are two emerging market needs that are probably ahead of vendor ability to deliver products. One of these is for products that can manage system nodes; for example, linked personal computers as well as host data centers and system control functions. The other market need is for application programs that are segmented to run in both the mainframe and micro environments in a linked fashion.

These will be difficult products to produce — from both design and implementation standpoints. In micro-to-mainframe environments, an important development for the remainder of the '80s, node management will be a critical issue. DBMS will have to adjust to being resident in diverse environments. A relational DBMS that is split between different machines but can be united where necessary is one promising path that is still in the research and development stage.

Segmented application programs that will operate in different hardware and software environments are another aspect of linked software. Systems software such as DBMS, node management and communications monitors will provide the foundation that will make this possible. Equally challenging will be the applications-based analysis required to decide how to split applications systems between mainframes and micros to best meet user needs.

The micro-to-mainframe bridge and end-user productivity tools are two "clusters" of functions that will naturally pull similar products into common products and vendor groups. Figure 2, on page 49, shows how these relationships will appear; these are much stronger links than those shown in Figure 1.

The common need that both clusters will have for communications may make communications monitors, measurement and local networks the battleground among vendors specializing in one cluster or another. Alternatively, all-inclusive systems software vendors may emerge, offering a wide portfolio of products.

The smaller systems software firms that now exist may not have sufficient human and financial resources to make these multiple transitions. Often, the smaller firms will be forced to coalesce to

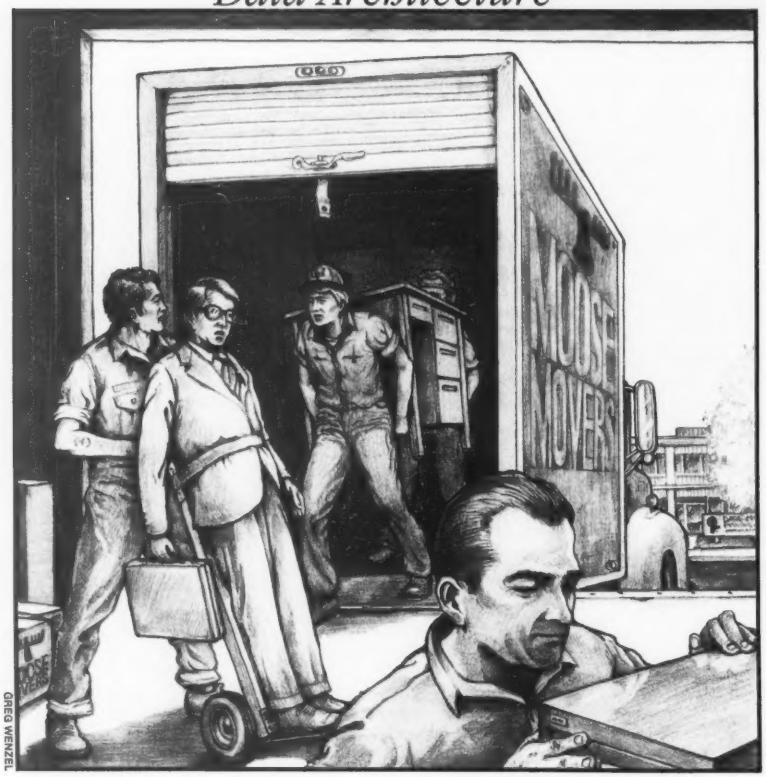
develop comprehensive products.

The larger, more mature firms will often be much better positioned, being able to develop and market a broad, integrated range of products.

Systems software conglomerates will be faced with the question of whether to offer applications software in addition to systems software. A few vendors, like Cullinet, have made the choice already. The choice for other vendors, especially the ones with established traditional products, however, will not be an easy or obvious decision.

There are significant benefits to offering a diverse selection of products. Diversification lowers technological and marketing risks and allows vendors to spread the cost of administrative and marketing overheads. There are greater opportunities for tie-in product sales, not to mention the opportunity successful vendors will have for account dominance.

On the other hand, organizational and technical management problems are daunting. Start-ups and development expenses will be high. Technical compatibility and product and user interface requirements may force products to the lowest common denominator. Sales training and coordination will be complex.



Will users and purchasers of software be better off in the future integrated environment? Vendors and products should be financially and technically stronger, respectively. Users will be faced with less need to make their own do-it-yourself linkages. Vendor-supplied linkages should be more robust, yet more flexible.

However, there will be fewer technical solutions to choose from and those that do exist may be bland, mass market products or overly complex all-things-to-all-people products. Innovations and variations beyond vendor-allowed parameters may often be quite difficult to obtain. This could put MIS and end users in direct conflict, with MIS trying to make up for package limitations.

Perhaps the biggest risk for the corporate customer is becoming dependent on a single software supplier. While possibly simplifying many aspects of an operation, this dependence would limit experimentation and the ability to blend the best products and ideas from a variety of sources.□

*The traditional management information systems department has become too bogged down with operational problems to pay adequate attention to strategic planning and corporate-level automation issues. One solution to this problem, however, may be the establishment of a data architecture group to take care of these longer range issues.*

The problems of data management are not new. Over the last 15 years, thousands of organizations have installed data base management systems (DBMS) in an attempt to resolve the problems of data access, redundancy, security and integrity.

However, this approach to a universal solution is not working. Management is generally dissatisfied with the return on investment for DBMS. Solutions have yet to be found for the specific technical problems data management packages were supposed to solve. While there is nothing wrong with acquiring a utility to improve the technical aspects of an information processing environment, this was not the way formal data management was sold to the organization and thus expectations were not met.

The primary frustration users have is the access to and flexibility of already automated data. It is very difficult for users to understand that the data they need to apply to a problem is resident in the system, but they cannot easily and quickly gain access to it. For the most part, little if any, resistance was encountered when the data processing department requested funds to buy a DBMS and establish a data base administrative function. However, the users have not seen a marked improvement in the availability of data and view the situation as another disappointment in a long string of deliveries which did not meet expectations.

In short, while improved internal efficiencies are nice, the real payoff in the eyes of the user community is data access and flexibility. This leads directly to the question of why data management has not fulfilled its initial promise.

The underlying problem is the lack of recognition that the difficulty is primarily managerial and not technical. This is understandable since the introduction of the data base system was by the technical staff and the product itself is a system utility, akin to the operating system, to be installed and managed by the technical support staff. Of all the subgroups within the data processing organization this group has the least experience with and exposure to end users. The problems of data accessibility and flexibility were either dismissed as trivial or the skills and expertise necessary to address the problem were not available.

What is needed to resolve this dilemma is an organizational refocusing that provides two things. First, the organization must create a business-oriented liaison to the users of information. Second, short-term, technically oriented work functions (that are very necessary given the presence of a DBMS) must be separated from the longer term, higher order problems associated with data availability and flexibility.

An approach that is being considered by some leading edge organizations is to place the user/data functions into a new organizational group called data architecture. This calls for a division of the data-related functions previously vested solely in the data base administrative (DBA) functions. Both of these units should report to the director of management information systems (MIS) or the equivalent executive.

The functions of the data architect broadly include strategic automation planning and application system integration.

**Strategic Automation Planning**

To achieve an enterprise-wide automation perspective the data architecture group must translate corporate strategic goals and objectives and the strategic business unit plans into a strategic automation plan.

Traditionally, there has been a great deal of difficulty in performing this translation. The vagaries and level of abstraction that most strategic business plans present to operationally oriented data processing departments are a primary reason for poor performance of this task. In addition, rarely, if ever, is the DP department treated as an integral element of the business and formally integrated into the main line of the business plan.

This situation notwithstanding, it is essential to establish a strategic automation plan to ensure that the proper automation resources and infrastructures are in place to support the business segments. The lack of such planning forces data processing into a reactive mode, always playing catch-up, especially when faced with longer lead times for equipment and more complex planning cycles for software. Furthermore, the lack of a strategic automation plan makes it almost impossible to develop an operational or tactical data processing plan which effectively supports, enhances and links to the corporate strategy.

Vesting the responsibility for the automation strategy with the data architecture group leaves the systems development and computer operations groups free to establish their tactical plans with the assurance that they coincide with established corporate goals.

Why, however, is the architecture group better able to develop the automation strategy than the traditional DP division? Two reasons stand out. First, the traditional data processing organization is production- and line-oriented. Their perspective is short-term, mainly revolving around producing products and putting out fires. It is almost too much to ask them to shift perspective and project, five to ten years ahead, the needed resources and accompanying strategies. Second, they hold an application view of the enterprise which is fixed into how things are done rather than how they should or can be done.

By developing a more global view of the information requirements of the present and future enterprise through such techniques as enterprise modeling — or entity/relationship modeling as it is sometimes called — and by being removed from the day-to-day pressures of production and systems development, attention and energy can be focused on the automation strategy.

From a user point of view, the primary focus of data processing is twofold — processing operational tasks; and providing management information to those charged with monitoring and controlling opera-

tional processes and those responsible for developing new products and establishing strategic goals for the organization.

By and large DP has succeeded in properly supporting the operational areas, but has fallen short in its ability to support the tactical and strategic requirements. The primary reason for the shortfall is that tactical and strategic groups are mainly qualitative or problem-oriented, as opposed to the procedural orientation of operational groups. As presently trained and oriented, systems analysts and programmers have a great deal of difficulty in building systems where the underlying process cannot be expressed in a logical series of steps. Moreover, a good part of the data needed cannot be expressed numerically, and the numerical data necessary resides in many diverse application systems which are not compatible either at the storage level or in their processing cycles.

While data management technology cannot solve personnel issues, it should be able to respond to organizational requirements. A corporate-wide or global view of the information requirements of the organization is necessary, whether it is used to extract information which cuts across functional business lines or to decide the optional clustering of business functions into discrete systems.

Thus, a primary function of the data architecture group is to build and maintain an enterprise model which will evolve an integrated systems architecture, which will in turn drive the systems development function in the form of an operational plan. This plan would establish the priorities for the system development resources and delineate the degree of systems integration.

This last point, the degree of systems integration, has been a subject of vast debate for over a decade. The goal that many organizations have articulated has been total integration of all systems. While this is technically feasible, it is unnecessary.

Perhaps the best way to illustrate the degree of integration issue is an analogy to an automobile. The various elements of the engine must be tightly coupled (or highly integrated) within very close tolerances. While there is a very definite relationship between the engine and the windshield, the coupling is less strong and the level of integration less critical.

Lack of this understanding has led to some very expensive failures, which have eroded the confidence and credibility in the data processing department.

Techniques such as IBM's Business Systems Planning or attempts to integrate from the bottom up via physical data relationship tools have been uniformly unsuccessful. While the technique of enterprise modeling is still undergoing refinement, it is merely a tool and not a substitution for the process of careful business analysis leading to systems integration.

The value of the results that stem from the enterprise analysis is directly proportional to the industry experience of the individuals performing the analysis. The clear implication for multi-industry organizations or conglomerates is that separate enterprise analyses must be performed for each distinct industry (for example, heavy manufacturing versus chemical manufacturing) with the corporate-level link being the integrated financial system.

Although it is valuable to use outside expertise to analyze the enterprise, it is more advantageous for in-house personnel to perform this task to ensure its direct applicability to the organization and to modify the model as needed to accommodate the changing organizational environment.

Staffing the data architecture group needs close attention. Early discussions about staffing requirements for the data administration function held at Guide meetings (the IBM large systems users group) in the late 1960s commonly used the term "supermen" to apply to the qualifications of the ideal personnel. This has obviously not been the case, nor will it be the case with the data architect.

The primary skills needed by a data architect are excellent, general DP technical skills in systems development and computer operations; competency in data management technology; and internal knowledge of at least one major DBMS including file and storage structures and relational data base concepts.

The data architect's expertise should encompass an excellent knowledge of the business functions performed; experience in establishing user requirements for application systems; and past experience in business and automation planning.

Obviously these skills and expertise will not be resident in a single individual. Therefore, a team will have to be assembled. It should also be noted that the number of staff required to initially build the model will be larger than the group needed to maintain it. A staff of six to ten people has proven adequate to construct the initial model whereas three to four are required to maintain and modify the model.

While several organizations have started their architecture group with the sole responsibility for automation strategy planning and systems integration in mind, other functions, such as application-functional requirements and DP monitoring and control (both system development and computer operations) have begun to shift to the architecture group as their natural home.□

# Announcing

# The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Services (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in 15 magazines devoted exclusively to supplying information to microcomputer users in: Australia *(MicroWorld, PC World)*, Brazil *(MicroMundo)*, Denmark *(Micro Verden)*, Finland *(Mikro)*, France *(Golden, PC World)*, Japan *(PersoCom World)*, Norway *(Mikro Data)*, Sweden *(MickoDatorn, Min Hemdator)*, Spain *(Micro Sistemas)*, The Netherlands *(Micro/Info)*, West Germany *(Micro-Computerwelt, PC Welt)*. And, your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of our 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

# *"IDMS/R represents a major advance in database technology."*

Dave Litwack*

## Because IDMS/R is the first relational DBMS designed for both the DP professional and the end user.

IDMS/R is not only a relational database management system, but a particularly powerful one. IDMS was made relational by removing all pointers and allowing the user to define data as tables and providing the traditional relational operators such as selects, projects and joins. The major benefit of a relational DBMS is the capacity to develop applications faster because the developer does not have to be concerned with the database design. IDMS/R provides this and much more.

For example, the Automatic System Facility (ASF) of IDMS/R is a major advance over fourth generation languages. The ASF is so comprehensive and easy to use that all a user need do, to develop an application, is define a relational record. The Automatic System Facility dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. So, the developer can witness the application being produced, literally, in seconds. This capability makes IDMS/R the perfect system for the end user.

Data processing professionals can use the ASF to help develop production applications. The ASF can be used to build a prototype that can be enhanced, using Cullinet's fourth generation language, ADS/OnLine, into a complex production application. But, when they build a complex high volume application using IDMS/R, DP professionals require outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R, they can simply change these relationships to predefined joins and benefit from a dramatic boost in performance. We call it Relational Fastpath. Relational Fastpath makes IDMS/R a unique DBMS and a perfect system for DP professionals' system development needs.

In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, full integration with personal computers and is also integrated with Cullinet's complete line of financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of those who want to develop applications faster and those who have the responsibility of processing them.

**David Litwack is Cullinet's Vice President of Product Development. Mr. Litwack has contributed significantly to the many technical advances Cullinet has achieved in database software products, including IDMS/R. Mr. Litwack joined Cullinet in 1976. He is a Cum Laude graduate of Brandeis University and holds a Masters in Computer Science from Boston University.*

# Introducing dBASE™/*Answer*™—the first micro-mainframe link that allows PC users to use mainframe data while taking full advantage of all Ashton-Tate's dBASE,™ FRIDAY!™ and FRAMEWORK™ software.

**Finally, your end users can get the most from your corporate micros.**

Informatics General and Ashton-Tate have joined forces to create a micro-mainframe link which works with Ashton-Tate's best-selling software.

This all-new dBASE/*Answer* system is the next logical step in the corporate use of micros. That's because it delivers end users more capabilities than ever before, including:

- **Universal Access** to IMS, IDMS, TOTAL, ADABASE, VSAM and virtually all other database management systems which operate on IBM mainframes.
- **Complete Support** for all dBASE, FRIDAY!, and FRAMEWORK software systems. Now end users can download information for database management, reporting, and distributed application development and use.
- **Ease of Use,** so even novice end users can get more information from their micro computers. All they have to do is select options (assisted by prompting) and dBASE/*Answer* handles mainframe interface and data delivery. The user receives completely formatted files, ready for use with dBASE, FRIDAY!, and FRAMEWORK software systems.

**In addition to all the end user benefits with dBASE/*Answer,* Data Processing professionals also get:**

- **Security** at the micro, mainframe, database *and* content level. dBASE/*Answer*'s unique password and user profile capabilities allow you to limit the information each end user can access.
- **Control** over system resources. Using dBASE/*Answer*'s request classification capabilities, your data processing department can provide immediate *or* deferred response to end user requests.
- **Selectivity** through dBASE/*Answer*'s qualification logic ability. It allows end users to select and qualify the data they want—and you to deliver only the data they need.

**Get the facts on dBASE/*Answer* and receive a *free* Demonstration Diskette.**

dBASE/*Answer* from Informatics can actually help you get your money's-worth from your company's investment in micro computers. And the easy way to see for yourself is by using the *free* Demonstration Diskette in your own micro computer.

# HARD FACTS

## ABOUT THE REAL LEADER IN COMPLETE SOFTWARE FOR BUSINESS: RAMIS II FROM MPG

### FACT:

### RAMIS II Is The One System For All Your Users

To meet the full spectrum of application development and Information Center needs, RAMIS II starts with the most advanced decision support capabilities: a powerful report writer, a complete relational language, full-color business graphics, and much more.

Then we add a data base manager robust enough for high-performance on-line applications, a multitasked TP monitor that minimizes overhead and state-of-the-art screen formatting.

The result is the only integrated data base/data communications system designed for both highly structured transaction processing applications and unstructured decision support systems. And, the only product designed to fully unlock the power of your IBM mainframe, whether it's a 4321 running SSX, or a 3081 running MVS/XA.

### RAMIS II Unlocks Your Existing Data

RAMIS II maximizes the return on your investment in data through ready access to ADABAS, IMS, TOTAL, DL/I and IDMS data bases, as well as VSAM, ISAM and sequential files.

With the most powerful report writer available, plus graphics, RELATE and even English comprehension, RAMIS II unlocks external data easily and efficiently.

### The Full Commitment And Support Of Martin Marietta

Leadership takes vision, plus the commitment and resources to turn that vision into bold new products.

To achieve our goal of a complete software solution, we have invested an average of 16% of annual revenues in research and development—more than twice the industry average.

Now, as part of Martin Marietta Data Systems, we offer a complete range of information solutions, from software products to professional services, from processing services to integrated systems. And, the financial and technical strength of Martin Marietta, a diversified company with more than $3½ billion in revenues, is accelerating new product development.

It takes more than a roar to be the leader. When it comes to providing a complete software solution, the facts prove there's only one real leader—RAMIS II from MPG.

To get all the facts, visit one of our regional Product Demonstration Centers, or attend a free RAMIS II seminar. For more information, call your local MPG office or call toll free (800) 257-5171. (In New Jersey call (609) 799-2600, Ext. 2325.)

**FACT:** More copies of RAMIS II have been sold than all other 4 GL's combined.

**FACT:** RAMIS II English comprehension responds to everyday English commands.

**FACT:** MPG developed the first practical relational language.

**FACT:** There's no more powerful system for screen-based applications than RAMIS II.

**FACT:** RAMIS II was the first product designed for both application building and Information Centers.

# Distribute your creativity.

## New INGOT makes decision support applications portable.

Introducing a real time decision support system—INGOT—a fourth generation language that allows you to share information in new ways.

Models and data files can be moved to almost any combination of mainframes, superminis, and minis. So, if you have an information center here, a subsidiary there, and a departmental computer somewhere else, just put INGOT on each machine. IBM, VAX, DG, PRIME, HARRIS, UNIVAC, TANDEM, WANG, etc., etc. are just alphabet soup to INGOT.

**PC TALK**

PC's and WF's talk to INGOT *without* special software. Upload and download. Move models and data files with ease using the same software you already have. Expand Lotus, dBase II, and calcs into true decision support.

INGOT handshakes with other programs through a standard flat file interface. INGOT models can access data base systems, pass data to color graphics programs, and execute programs in other languages. INGOT amplifies your existing software assets.

**SIMPLY POWERFUL**

English-like commands do time series forecasting, LP optimization, simultaneous equations, Monte Carlo simulation, statistical curve fitting, and more. Sales forecasting and optimal manufacturing scheduling can be integrated into a single model using INGOT.

What's your application? Financial consolidation? Long range forecasting? Employee evaluation? Departmental budgeting? Spread sheets? R&D project selection? Customer credit analysis? Transportation scheduling? Cash management? Monitoring competition? With your creativity, there are probably 10,000 portable applications you can build in INGOT.

Serious model builders love its power. Yet spread sheet users graduate easily to INGOT's fourth generation capabilities. INGOT satisfies more needs and more users with the same DP$.

**BUILT-IN MODELS & GRAPHICS**

Proprietary models are built-in as single commands to save users time. From replacement value accounting to stock price estimation, there's nothing like INGOT.

Draw a floor plan and insert cost estimates. Draw a map and show sales by region. Ordinary pieplots, lineplots, Gantt charts, and bar graphs are one line commands.

**HELP+**

100% of the user's manual with 200+ examples can be accessed on-line by typing HELP. Add your own HELP messages to the system too. User training, consulting, and hot line support assure your success.

ACT NOW and call or write for more information.

# THERE'S ONLY ONE UFO.

A lot of software suppliers are trying to fit into UFO's shoes these days. They'll try to tell you that their On-line Application Development Systems are as powerful...as proven...and as accepted as UFO. They'll try to persuade you that they can offer you UFO's dramatic reduction in the time and expense of developing your CICS and IMS/DC applications. That's what they'll try to tell you. But the revealing and indisputable fact that UFO now has more than 1,500 installations ...more than all other independent suppliers combined...is your absolute proof that there's only one UFO.

**No other On-line Application Development System can match UFO's speed, performance and cost savings.**

UFO helps you melt away your programming and maintenance backlogs by eliminating the prime source of inefficiency in the application development process...repetitive coding. Pre-programmed and pre-tested functions like..."add, update, copy, browse, and display"—are initiated by keying in simple commands. There's no complex new language to learn, no code to write. Even access to your DL/1 database requires no special database training. With UFO, all your programmers can quickly become CICS or IMS/DC application development specialists without extensive and expensive training.

Because UFO is a non-procedural system, the time required to initiate new programs is dramatically reduced. Your programmers are guided through the development process with a free-form screen PAINTing facility, data dictionary, menu assistance and help screens. Simple fill-in-the-blanks techniques focus activity on what's to be done, not how to do it. And applications can be developed interactively with end-users, permitting changes at the prototype stage for guaranteed end-user satisfaction.

If you're concerned about reducing the time and cost of developing, maintaining and securing on-line applications...call in the best. UFO...User Files On-Line...from Oxford.

# OXFORD JUST TAUGHT CICS to COBOL

## UFO/COBOL™ replaces Command Level COBOL with plain vanilla COBOL.

UFO/COBOL is the perfect answer to your procedural on-line programming needs. For the first time, all your COBOL programmers can now develop CICS applications without learning one word of new code. No longer will the lack of specialized Command Level programmers be a barrier to satisfying the growing demand for more on-line applications. Now your present staff can put their ANSI COBOL programming skills to work cutting your backlog of on-line applications…doing it faster, more efficiently, more automatically than ever before.

Without modifying your on-line environment or operating system, UFO/COBOL takes standard COBOL commands, and automatically translates them using a unique COBOL compiler into the language necessary for CICS program execution. Your ability to utilize the substantial benefits of the on-line environment increases enormously, while your programmers continue to write in a familiar and natural way.

**An example of UFO/COBOL commands.**

| In COBOL | In Command level | In UFO/COBOL |
|---|---|---|
| DISPLAY (SCREEN-NAME) | EXEC CICS SEND MAP ('XDFHCMA') MAPONLY ERASE END-EXEC | DISPLAY (SCREEN-NAME) |
| READ (FILE-NAME) | EXEC CICS READ DATASET ('FILE-NAME') INTO (FILE-NAME) RIDFLD (KEYNUM) END-EXEC | READ (FILE-NAME) |

### UFO/COBOL defines CICS 3270 screens on-line.

In addition to extending the capabilities of your programmers, you'll find that UFO/COBOL is a powerful new method to speed-up the CICS application process dramatically. Built into UFO/COBOL is an interactive screen painting facility that lets you design CICS 3270 screens on-line. UFO/PAINT allows you to build or modify screens without writing one line of code. You design the screen simply by positioning fields where you desire. Then COBOL data descriptions are *automatically* generated from the screen.

### UFO/COBOL makes prototyping easy.

By quickly defining a sequence of screens, you can prototype the final system…testing and modifying each screen before writing code. You can develop applications interactively with end-users, gaining all the efficiencies of their direct involvement.

### Developed by Oxford…#1 in CICS application development.

UFO/COBOL is a development of Oxford Software Corporation, the leading independent supplier of on-line application development software. With more than 1500 installations of UFO…the premier, 4th generation non-procedural approach to application development …no one knows more about the CICS application development environment than Oxford.

If you'd like to learn how you can dramatically add to your on-line development capabilities, using your present programming skills, call in the leader. Call Oxford today.

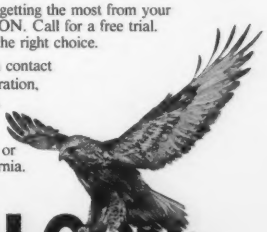
# FALCON
# on-line data entry that's above and beyond the ordinary

For an easy-to-use, completely interactive data entry system that's designed especially for the end user, you need FALCON.

FALCON operates standalone or as a task under CICS and the other major TP monitors giving you total flexibility and performance. It supports both DOS and OS operating systems to provide versatility and upgrading capabilities. And FALCON automatically converts VIDEO/370 formats.

FALCON's high-level security system protects your data against unauthorized access. It lets you decide which operators can use specific functions. And with FALCON you never worry about losing data. If the system fails, all data is recovered. If a terminal breaks down, just go to another terminal, rescue your data, and start working – right where you left off.

FALCON's on-line instructions help you design screen formats, enter and verify data, maintain files, create tables, and submit your own jobs. Just touch a key, tell FALCON what you want to do, and the instructions appear right on the screen.



With FALCON, you can make decisions based on the productivity of your operators without leaving your office.

You can monitor the progress of all active terminals and view job accounting statistics on-line.

FALCON's built-in edits include table lookup, range testing, defaults, balancing, and much more. FALCON goes far beyond other data entry systems to let you use your terminal as an operator's console and view the activity and contents of the input and output queues.

So make sure you're getting the most from your resources. Choose FALCON. Call for a free trial. You'll be glad you made the right choice.

# Index to Systems Software

This tab section includes the Applications Development Tools (App. Dev.), Compilers/Assemblers (Comp.), Languages (Languages), Library Management (Lib. Mgmt.), Operating Systems, Performance Measurement (Perf. Meas.) and Systems Resource Management (Sys. Res. Mgmt.) software categories.

The products have been indexed by major operating system: each section contains those packages which run on a specific operating system or operating system family. Index entries contain information on the vendor, package name, the product type and the page number on which the complete product listing can be found.

# Nearly Nine Million Computer-Involved People Around the World Rely on Our Publications For the News They Need.

We're CW Communications/Inc.; the world's largest publisher of computer-related newspapers and magazines. And wherever you go in the computer world, you'll find computer-involved professionals reading—and relying on—our publications. With highly trained and experienced editorial staffs all over the world, our publications give readers the best and most up-to-date information available in this rapidly changing industry.

## Around the world:

We publish, co-publish or provide editorial services to the leading computer publications in the world, including publications in all of the following countries:
Scandinavia—Denmark, Sweden, Norway. Finland
Western Europe—West Germany, United Kingdom, France, Italy, Spain, Greece, the Netherlands.
The Mid-East—Kuwait, Saudi Arabia.
Asia/Africa—People's Republic of China, Korea, Japan, Singapore, Southeast Asia, South Africa, India.
The Southern Pacific—Australia.
Central and South America—Mexico, Brazil, Argentina, Chile.

## In the United States:

In the world's largest computer market, we publish a whole series of publications that cover different aspects of the industry. Our largest publication, with more than half-a-million readers every week, is *Computerworld*, a weekly newspaper aimed primarily at larger computer users. Its companion publications include *Computerworld Office Automation*, *Computerworld on Communications* and a series of *Buyer's Guides* covering all major segments of the industry.

In addition, we publish *MICRO MARKETWORLD* for dealers, distributors, retailers and others involved in the microcomputer marketplace. For microcomputer users, we publish *Infoworld*, *Microcomputing*, *PC World*, *MacWorld*, *jr*, *80 Micro*, *inCider*, *Run*, and *Hot CoCo*.

No one in the world publishes more computer information for more people in more countries than we do. And we'd be happy to give you more information on any of our publications. Just send a telex to our U.S. offices, attention CW International Marketing Services, (telex #95-1153) or write us at the address below.

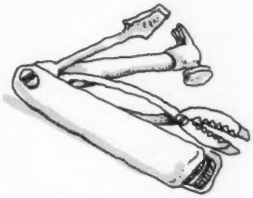
# A few graphic words from our InterTest™ users:

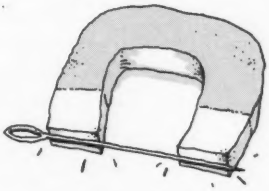
"Testing without InterTest is like climbing a mountain without a rope."

Arthur R. Connal,
Technical Services,
The Home Insurance Co.



"Makes CICS debugging a breeze."

Neil A. Wells,
Manager Systems & Programming,
Top Value Enterprises.



"It provides an invaluable diagnostic capability."

Alan F. James,
Systems Analyst/Systems,
First Security Bank Of Utah.

"Best tool on market to help CICS program development."

Joseph C. Chen,
Senior Project Leader,
Briggs-Weaver.

"Unmatched for finding a needle in a haystack."

Charles C. Allan,
Manager, Computer Operations,
Carborundum Co.

"Greatly speeded the debugging process up."

Robert W. Belden,
Technical Support Programmer,
R.I. Hospital Trust National Bank.

A survey was recently sent to the users of InterTest software, the industry standard for CICS testing and debugging. As you can see, the comments speak for themselves.

Call today for more information or a copy of the survey results controlled, compiled and tabulated by one of the nation's leading public accounting firms. InterTest works hard for its 1,400 users. And On-Line Software International can prove it.

*Additional information provided for by vendor*

Developed for users of IMS DB/DC; CICS, DL/I; CICS/IDMS; and CICS/VSAM, APS increased productivity during the development and maintenance of on-line and batch Cobol-based applications. Housed in a precompiler architecture, APS unhooks from resultant applications and generates native-level source outputs. Adds no runtime overhead.

# DOES VSAM HAVE YOU *"UP A TREE??"*

## THEN YOU NEED
## VSAM PRODUCTS FROM SOFTWORKS

**VSAM—ASSIST**
Installed on over 300 systems to back up and restore VSAM files and catalogs quickly, efficiently, and safely. Dumps files to a variety of storage devices in only 10% of the time required by REPRO. Automatically adjusts for different track size when migrating from 3350 to 3375/3380 DASD. ICF Support included. For all OS/VS systems.

**QUICK—INDEX**
Loads alternate indexes in one-fifth the time required by BLDINDEX. Eliminates the need to establish VSAM sort work space. For all OS/VS and DOS/VS(E) systems.

**VSAM SPACE MANAGER**
Provides total management of VSAM space through a "public VSAM facility", eliminating the need to identify specific volumes when allocating VSAM space. Also allows users to "place" clusters and catalogs by absolute track address minimizing arm movement on the volume. For all OS/VS systems.

**VCAR**
A VSAM—COBOL I-O Logic Error Display facility that frees application programmers from the time-consuming searching and guess work involved in dealing with I-O logic errors by allowing the quick determination of the causes of those errors. For all OS/VS systems.

**VSAM I/O PLUS**
VIO Plus is the newest addition to the proven family of VSAM tools offered by Softworks, Inc. VIO Plus improves performance in every sense of the word: jobs will perform fewer I/O operations (EXCPs), CPU time will be reduced and elapsed time will be reduced by up to 75%. In short, you will see a very noticeable increase in throughout.

# CICS PRINT FACILITY

CPF now unties more knots! Release 3.0.0 is more user friendly and more efficient than the previous release. Print online or batch reports anywhere within your CICS network with greater efficiency than ever before possible. CPF makes it as easy as loosening your tie!

**Standard CPF Features**
(new functions highlighted)

**FOR THE USER:** Active index of all reports, security network, menu driven, *individual page print, ability to affect all reports displayed on index with one entry,* help screens, report display on terminal print interrupt and restart, screen copy, message sending, multiple copies, multiple destinations.

**FOR THE PROGRAMMER:**
Online Spooling, Multiple Task Spooling, Batch Spooling, *Array Mode,* Predefined Report, *Automatic ENQUEUE and DEQUEUE, Enhanced BMS Support, Direct Spooling.*

**FOR THE SYSTEM ADMINISTRATOR:**
Three tier security network. *Unlimited number of system and domain administrators, automatic report aging.* CPF control file. *Sync point and recovery restart, direct spooling to CPF report data set, blocking of data from batch sources.*

CPF operates under MVS with JES 2 or JES 3, and is not release dependent upon CICS. CPF will work with BTAM, VTAM, or TCAM. CPF is now available for DOS/VSE POWER.

Call or write today for more information or a free 30-day trial and *loosen your tie!*

# THE POWER OF JOHNSON SYSTEMS SOFTWARE

Information gives you the power to make intelligent management decisions. For more than a decade, Johnson Systems has provided management the information to more efficiently and more effectively run their Data Center. Our well-established line of products has helped guide over 3,500 users worldwide through the problems of Data Center management.

The integrated software approach we offer allows you to operate your Data Center as an efficient business. Our Job Accounting Report System (JARS), enables you to monitor and report on resource utilization; JARS/CICS gives you reporting capabilities on CICS usage; APEX automates production control, eliminating human error and costly reruns. Our unique approach can result in credibility with corporate management and a competitive edge in your marketplace.

# Networks are expanding faster than anyone expected

...and controlling that expansion, whether it's in data processing or data communications or both, is almost impossible without **NETMAN**™, the network information system that gives you a complete on-line audit of your dp environment. **NETMAN**...

- Optimizes your inventory and reduces equipment shortages with up-to-the-minute status reports of all hardware and software.
- Eliminates installation delays by tracking your entire configuration so that plans for expansion stay on target.
- Minimizes problem outages by pinpointing trouble spots and showing their status.
- Tracks vendor response and improves their performance.
- Validates invoice details, contracts and leases for financial control and enormous savings.

There isn't a network out there that won't benefit by having **NETMAN** installed.

Available for TSO, CICS and CMS.

ZEKE™ THE CONTROLLER

SUPER SOFTWARE HERO for DOS/VSE Scheduling That Understands Your Language!

ZEKE understands English and is the most widely used DOS/VSE scheduling software in the world today. ZEKE doesn't sit on the shelf gathering dust, but goes right to work to improve data processing department productivity. Forgotten runs are eliminated and sequencing errors are greatly reduced.

*ZEKE actually makes scheduling easy. For example:*

**Tell ZEKE what to run:**
**(JOB PAYROLL)**
**Tell ZEKE when to run:**
**(OCCURS THURSDAY SCHED 10:30)**
**Define prerequisite/requirements:**
**(EOJ PAYEDT)**

In this example, ZEKE will not run job PAYROLL until job PAYEDT has gone to a normal EOJ.

Define it once, ZEKE doesn't forget, and the user gets his output on time. You tell it like it is . . . and ZEKE does it like you want.

For complete information, including user references in your area on ZEKE—THE CONTROLLER, call or write.

# Introducing.
# Software for the operations manager.

## The automated DOS/VSE data center.

C System Scheduler

It's Corodale's new System/Scheduler. A better way to log, schedule and monitor processing activity.

System/Scheduler organizes the data center. Eliminates no runs, misruns and reruns. And adds efficiency, accuracy and integrity.

Moreover, we can prove it with a no-obligation trial. Your facilities. Your work. Your savings.

Simply call us at 617 · 426 · 8780. Or write: Corodale Incorporated 133 Federal Street Boston Massachusetts 02110.

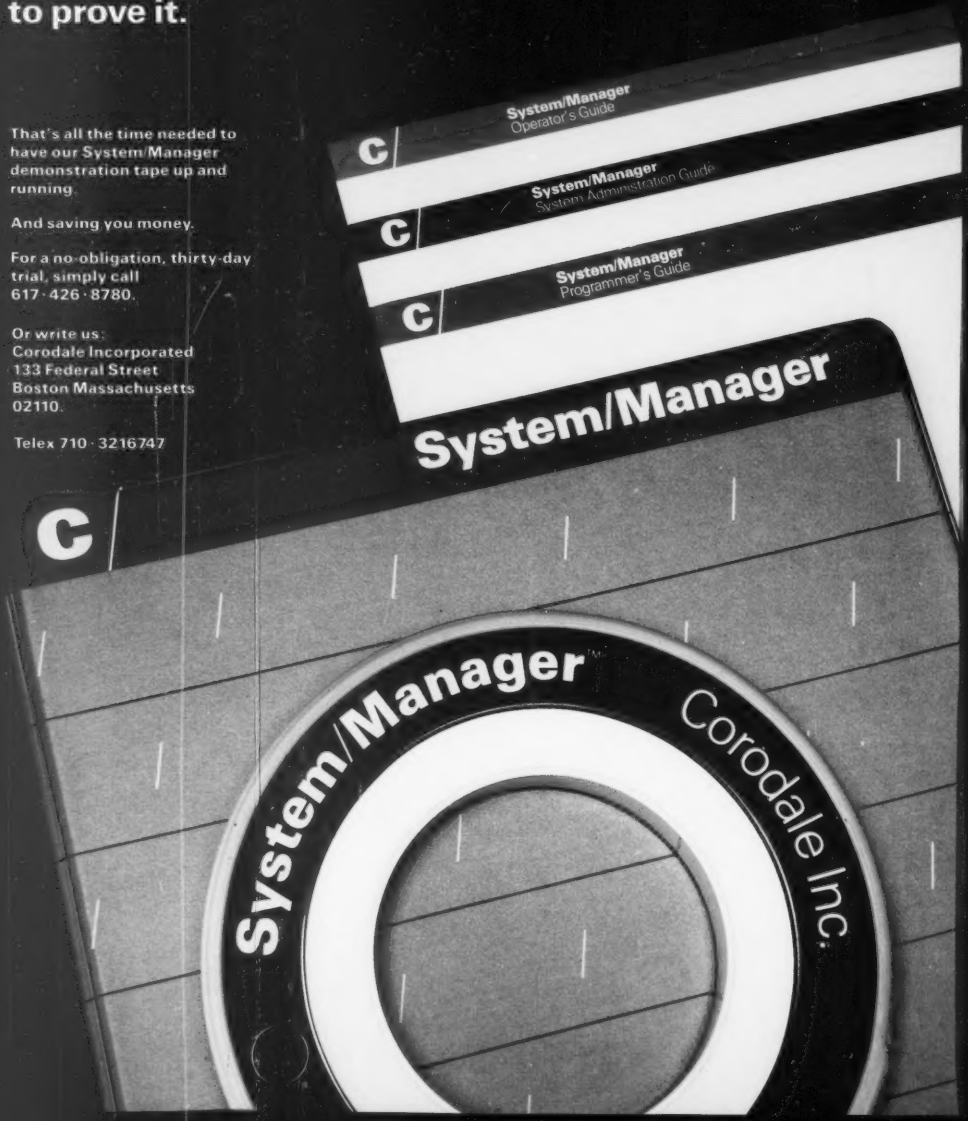
C
UTILITY SOFTWARE

# It took us five years to develop the best DOS/VS(E) disk/tape manager.

## It will take you ten minutes to prove it.

That's all the time needed to have our System/Manager demonstration tape up and running.



And saving you money.

For a no-obligation, thirty-day trial, simply call 617·426·8780.

Or write us:

# CONDOR
# on-line programming that reaches new heights in productivity

To get the most from your IBM mainframe, you need CONDOR – a reliable, easy-to-use, high-performance system that soars above the rest through improved programmer productivity and low resource consumption. CONDOR's highly efficient processing methods and I/O facility improve system response time and can substantially expand the capacity of your CPU while minimizing personnel requirements.

You can write and edit programs with CONDOR and submit them for compile or execution. You can view and modify data from input and output queues, release or cancel jobs, and spool output to local and remote printers.

CONDOR's built-in library management system automatically reorganizes as you process for optimum conservation of disk space. In addition to offering stringent security against unauthorized access and supporting multiple versions, it provides detailed audit reports and program cross-referencing – both batch and on-line.

Boosting productivity even more, CONDOR's own high-level interactive programming language lets you create programs and JCL in a fraction of the time required with other languages. And a powerful set of interactive utilities makes system maintenance a breeze.

CONDOR operates standalone or as a task under CICS and the other major TP monitors to give you total flexibility, and it supports DOS/VS(E) and MVS operating systems for versatility and upgrading capabilities.

No wonder respondents to a recent Datapro survey rated CONDOR tops in reliability, efficiency, ease of use, ease of installation, support, and realized financial savings.

So for a system that out-performs the others and gives you complete control of all your data processing, choose CONDOR. Call for a free trial. You'll be glad you made the right choice.

# Index to Utility Software

This tab section includes the Data/File Management (D/F Mgmt.), Graphics, Query Language (Q. Lang.), Security/Auditing (Sec./Aud.) and Sort/Merge software categories.

The products have been indexed by major operating system: each section contains those packages which run on a specific operating system or operating system family. Index entries contain information on the vendor, package name, the product type and the page number on which the complete product listing can be found.

## AID / APPLIED INFORMATION DEVELOPMENT, INC.

**JCLWTR - THE SYSOUT RETRIEVAL**
**Specific Application:** Retrieval and Storage of JCL Sysout Listings
**System Requirements:** IBM 30XX, 370/158; NAS AS/7000, 9000
**Operating System:** MVS
**Memory Required:** 32K bytes
**Source Language:** Assembler
**Source Code Available:** Yes
**Purchase Terms:** Purchase
**Price:** $7,500
**Number Installed:** 12
*(See Vendor Profile Page V-3)*

*Additional information provided for by vendor*

JCLWTR
Sysout Storage & Retrieval System:

- Eliminates need to print Sysout
- Sysout/Job data available on-line
- Variable search criteria
- Helps spot problems/prevent rerun
- Prints processing exceptions
- Tape/Microfiche Archival
- No systems modifications required
- Free 30-day trial

# We offer more ways to help you manage a project than anyone else.

*"Look Fenton, just make sure everyone knows how to use the system, what the plan is, and how to get it done. Because I don't want to hear anymore about it."*

As the world's leader in project management systems, we offer the widest range of systems and methodologies. And we can provide all the training and support you need.

**The Leading Project Management Sytems**
AGS provides you with the leading project management systems to plan, monitor, analyze, cost and manage any type of project. Our PAC II and PC/70 systems are used by over 2000 major companies and government agencies worldwide.

**State-of-the-Art Methodologies**
Our systems development methodologies have the most up-to-date structured analysis, design and programming techniques including automated estimating.

**Complete Back-Up**
AGS Management Systems offers complete training and support—before, during and after installation. For more information, write to AGS Management Systems, Inc. 880 First Avenue, King of Prussia, PA 19406. Or call:

# Disk Space Running Short On Your VAX?
# **Archiver** Is the Answer.

**Archiver,** Strategic Information's proven archive-and-retrieval package that reduces your storage costs, is an attractive alternative for every VAX system manager faced with the burden of adding additional disk drives. **Archiver** allows you to migrate selected files from expensive disks to cost-effective tape with minimum operational impact while retaining file availability on demand.

Notable features of **Archiver** include…

- An on-line directory of archived files for each user.
- Easy user interface implemented as DCL commands.
- Support for all VMS file structures.
- System manager option to *automatically* migrate user files to archive storage.
- Automated operator interface.
- Optimal tape capacity and throughput via unique access method.
- Insurance against tape failures through redundant use of tapes and error detection.

**Archiver** is a trademark of Strategic Information, a division of Ziff-Davis Publishing Company.
VAX and VMS are registered trademarks of Digital Equipment Corporation.

Available immediately for VAX/VMS systems, **Archiver** is the automated answer to your storage requirements that also allows you to control storage costs. To find out more, please call or write us at the address below.

# MVS Users Save
## 80% to 90% of your key strokes

**Dataset Management Facility - DMF**

- An **Indispensable Tool** for all MVS installations.
- VTOC and catalogue information in **one display.**
- Totals of **space utilization.**
- Edit, Browse, Delete, Rename any dataset with simple line commands.
- Left/Right scroll the dataset information independently of the dataset name -3 additional screens available.
- Enter the DMF tutorial.
- Open another DMF window on MVS file system.
- Directly invoke some ISPF/POF panels - when the PDF function ends, the DMF display reappears.
- Perform any number of line commands with only one "Enter". **DMF in some cases is five to ten times more efficient than current tools.**

DMF - will not only increase **Productivity but the Ease-of-Use** characteristics will bring the Power of your system to all **End Users** who require access to MVS data and facilities.

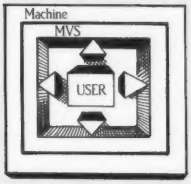
# Security in VM

## *A Different Paradigm*

Last night someone accessed the personnel database. Was this for a legitimate business need, or is your VM system wide open? Your computer holds the design plans for the company's hottest new product to be introduced next month. Who has seen, or even copied those plans?

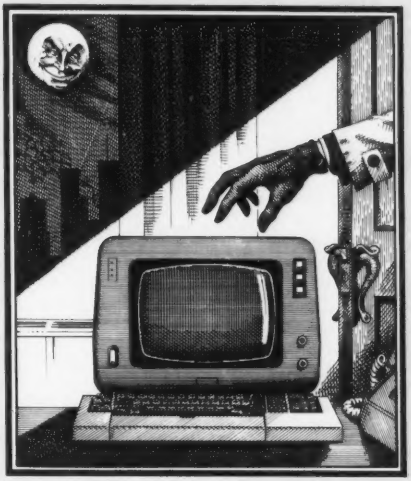


You need security for your system, and for the applications and data it supports. Meeting these security needs requires an entirely different approach in a VM environment than in any other environment.

### THE SECURITY ENVIRONMENT

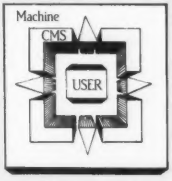
When most people think of security for an IBM mainframe, they have as a mental starting point one of IBM's batch operating systems. Given that DOS has been around since the 60's and MVS since the mid 70's, this is understandable.

So most people have a mindset that links a security system to an *operating system*, rather than a *machine*.



Traditionally, the operating system controls the user:

In fact, in MVS, it controls the user at a *logical* level. It ordinarily allows access only to datasets and other logical entities.



### THE VM ENVIRONMENT

Under VM, multiple virtual machines can be run on one real machine. Inside these 'machines', various sets of instructions, or operating systems, can be run. For example, one virtual machine might run CMS, another DOS or MVS. A unique feature of VM is that each virtual machine (or user) is separated by hardware from other virtual machines on the same CPU. Each virtual machine functions independently of the others, making sharing of resources between machines difficult at best.

### THE COMPARISON

In contrast to other IBM mainframe environments, such as MVS, the VM control program (CP) allows *physical* access to equipment. Thus, a user can access any logical piece of a physical entity in his virtual machine:

What this means for security is that a user in VM can *bypass* a logical system such as CMS and do physical access in his virtual machine. For example, a user in MVS cannot execute a privileged instruction, such as starting I/O to a device. He must ask MVS to do it. In VM, a user can do it easily.

### THE MISCONCEPTION

The main liturgy of the security gurus goes something like this: We must:

1) Define ownership of all resources (tape, disk, machine access, etc.),
2) Specify rules to access those resources (hence the buzzwords "resource access control"), and
3) Manage and monitor this effort.

This is what you get with a package from IBM such as RACF on MVS.

One might conveniently think that the low level commands from such an MVS security implementation could be 'moved' to VM, but this is a dangerous misconception.

Any security facility implemented in an operating system within VM, such as CMS, whose usage can be bypassed, is just smoke—not realistic at all. Think of a security system that modifies every possible CMS command to control logical access to files. Sounds good, but any programmer can write a program *outside* CMS to beat it, or copy an unaltered version of a command from one of 10,000 plus other VM systems.

The virtual machine is the only level at which a VM system can be secured.

### THE SOLUTION

First, what does VM itself offer for security? The VM directory defines users (virtual machines) and maps virtual to physical resources for those users. It contains a password for each user to access the system, and an optional password for access to each user's disk by others. In fact, VM is relatively secure when users need not share. The simple reality though, is that programs and data must be shared among users.

To be effective, a security package must work within the constraints of, and address the vulnerabilities of VM. It must be implemented at the control program level of VM—where it cannot be bypassed in CMS. It must be built within the VM directory scheme, so that it becomes an integral part of the VM system, and it must not require modifications to any part of VM or CMS.

The issue of security in the VM environment cannot be approached in the same way as for batch operating systems. It requires a vendor who understands the intricacies of VM to develop a security package to meet the needs of the VM community. It requires a vendor with the creativity to implement a system that addresses the unique features of VM.

VM Software Inc. is the undisputed leader among vendors of system software for the VM environment. Our newest product, VMSECURE, was designed by our experienced staff of VM professionals. VMSECURE is a resource access control, directory management, and disk space management system designed specifically to address the security needs of VM users.

# Index to Financial Applications Software

This tab section includes the following financial software categories — General Accounting (Gen. Acct.); Accounts Payable (A/P); Accounts Receivable (A/R); Fixed Assets; General Ledger (G/L); Purchasing; and Integrated Accounting (Int. Acct.). The products have been indexed by major operating system: each section contains those packages which run on a specific operating system or operating system family. Index entries contain information on the vendor, package name, the product type and the page number on which the complete product listing can be found.
